Did you know?

Productivity software is less expensive if you buy it when you order your new computer. Plus you save the hassle of installing the software yourself.

➔ **UPGRADE** to Microsoft® Office Basic Edition 2003 (includes Word, Excel and Outlook®) for only \$299*

Why are Flat Panels so cool?

- Bright, sharp, flicker-free images
- Designed to reduce eyestrain
- Maximum image size in minimal physical space
- Up to 40% longer useful life than a CRT monitor
- Looks great too!

What can a DVD* Burner* do?

- Store almost 7x the capacity of a CD on a DVD
- Burn home movies or photos onto a CD or DVD
- Play and burn CDs from your own collection
- Play DVDs
- Give you the space to save what you create

Upgrade to Business Class. An extra level of performance and value from the leaders in Multi-Function Centre® technology.

This is the MFC-8840D, the latest in a long line of award winning laser Multi-Function Centres (MFC) from Brother. An affordable, high volume, networkable, black & white, laser 5-in-1 MFC ideal for the workgroup. Now, here's a little more detail:

High Performance features: 5-in-1 with fax, copier, printer, scanner, and PC fax all in one unit - operate and store only one machine • 20ppm print speed means less time waiting for print out • Duplex printing saves on paper costs • Versatile flatbed scanning and copying • Super G3 33.6Kbps lowers fax call costs • Up to 550 sheet* paper capacity** tucked neatly under the MFC reduces time spent replenishing paper • Convenient 50 sheet* Automatic document feeder • Access frequently used numbers easily with 340 Quick Dials • Options: paper tray**, memory**, network card** • PCL 6 and Postscript 3 emulation • Internet faxing** (with optional network card).

Reliability: Brother MFCs are used, evaluated and trusted by businesses, corporate and government bodies all over the world. Our commitment to building the best is proven by both our position as market leader and exacting international ISO 9001 accreditation.

Easy to use: Easy to set up • Comes with online and built-in self help tools • Clear, simple backlit display and keys • Use more than one function at once with simultaneous function operation • Scan to e-mail/OCR/image/file (including PDF) • Plug and play optional network interface** with web based network management • Wireless network option** • Consumables compatible with other Brother MFCs and printers • Compatible with most existing software.

Support: The Brother MFC 8840D comes with a 2 year manufacturer's warranty. Not to mention an extensive support system including a Help Desk, 24/7 online self help tools and a network of Authorised Warranty Centres.

Environmentally friendly: Brother toner cartridges are recyclable for zero waste through the Planet Ark Recycling program • Toner Save and Power Save modes • Long life drum • 2-in-1 and 4-in-1 printing • Exacting international ISO 14001 accreditation.

Cost effective: With all the above features, average running costs of a mere 2.7 cents per page**** and the ability to provide duplex printing, the MFC-8840D represents the perfect combination of advanced quality balanced with exceptional value for money.

At just RRP \$1199*** it's quite clear that the Brother MFC-8840D is first class for Business Class.

At your side.

WORLD FIRST!

Free LASER blank 4.7GB DVD+R

brought to you by

LASER

MAKING GOOD PRODUCTS GREAT

Leading the way in DVD media
(silver surface) | inkjet printable | thermal printable

SPECIAL OFFER! Samsung DVD burners & LASER DVDs

Free DVD+R

Burn up to 4.7GB of data onto our free LASER DVD+R! Better suited for PC use than DVD-R media, the DVD+R is perfect for storing a variety of data, ranging from apps to videos.

And if you don't have a DVD burner that can write to DVD+R/RW media, now is the time to get one. Turn to page 92 for eight reviews of the latest DVD burners, and page 94 for the five of the best authoring applications.

Browsers

Check out the latest releases of the most popular browsers for Linux, Windows and Mac OS, including complete installations of Microsoft Internet Explorer, Mozilla, Firefox, Opera and Safari.

DVD POWER KIT

This month we've crammed in firmware updates for over 80 different models of DVD burners available in Australia. Also included are freeware and trial applications for analysing drives and media, converting DVD-Video, patching your drive and burning DVDs.

- DVD Genie 4.10
- Nero InfoTool 2.21
- VirtualDub 1.5.10
- Nero 6 Demo
- DeepBurner 1.1.128
- XMPeg 5.03
- DVDINFOPro Freeware 2.60

UltraISO 6.1

UltraISO is a CD/DVD image file creation, editing and conversion tool that allows you to directly edit an image file. Apart from the ability to extract files and folders from image files, it can also build new image files from your CD/DVD and maintain bootable files or information on your hard disk.

As sold for
US\$29.95

For Windows 98, Me, 2000 and XP.

WINner Tweak 1.4.0

Tweak, optimise and tune your installation of Windows 2000 Professional or XP with WINner Tweak. This month, we've included an exclusive special build of WINner Tweak 1.4 that will never time out. Upgrade to WINner TweakSE-2 2.6.6 and receive a 30% discount off the RRP. This offer is available exclusively to APC readers.

For Windows 2000 and XP.

PC SUPERMARKET 138 to 140

Our cover disc extravaganza this issue celebrates two major milestones: Microsoft's awakening to the reality of the Internet with XP Service Pack 2, and the liberation of the hard disk by DVD burners.

Windows XP Service Pack 2 is a big deal because Microsoft has struggled to match its software to the Net. When the Internet first arrived, Microsoft decided not to cooperate, but to compete with an atrocity then called MSN (seen as On Australia here, and not to be confused with the existing Web-based service). I still remember the original MSN interface, in which you clicked on a hyperlink and the document would fire up in Word rather than a browser! Back then, the Net was just a competitor, like Apple's e-World (remember that one?).

With Windows XP and later versions of Internet Explorer, Microsoft finally began taking Web integration seriously — except it vastly underestimated the security issue.

The company planned to introduce the fixes in the next version of Windows, but decided to bring these forward into XP when it realised it needed more

protection against Slammer worm-type attacks. So SP2 is really a Longhorn feature set delivered ahead of time. There's 475MB of Service Pack 2, which makes it a seriously large download for those on dialup connections (or \$29.95 broadband plans). To save you the hassle, we've put it on a CD. The patch will install just like a regular software package.

The blank DVD+R on our cover disc set is our way of saying it's time to liberate your hard disks. Average hard drive capacities are simply not keeping up with storage needs brought on by the arrival of video on the desktop. Drives in new machines now range from 120GB to 180GB — but even that won't last long to fill.

One theory on what's driving the rush to DVD burners is that everyone is copying commercial movies and that this is the biggest illegal mass movement since people started using peer-to-peer networks to download music. But DVD burners answer a much simpler, more fundamental need: the desire to free up hard drives without having to spend all weekend burning their contents onto 200 CD-ROMs, or having to purchase specialised backup hardware.

A lot of us want the infinite hard disk — the ability to store thousands of applications, hundreds of hours of video and multiple

operating systems, and access them simultaneously. Video is the main space hog, but it's not just home movies or copied commercial movies — it's becoming an important part of business and marketing communications. I see it increasingly in PowerPoint presentations, Web sites and even on monitors in shop windows. We are becoming a nation of movie producers and the internal storage hardware of our PCs is not keeping up.

With the arrival of DVD burners, I can now store around one hour of raw digital video on a couple of DVDs (or one Double Layer DVD). After editing, I can save the movie in a format that's playable on ordinary DVD drives or standalone players. Previously, I gave people CDs with WMA or MPEG files to be played on computers. Now I just burn videos onto DVDs and they can be watched in any home or boardroom with a DVD player attached to a TV.

The free blank DVD+R comes courtesy of NaSa Multimedia Technology, an enterprising local company which is becoming one of the major players in the CD and DVD media market.

I mention the company in my editorial because NaSa has actually put its money where its mouth is by letting APC readers sample its blank LASER-branded DVDs, which normally retail for a few dollars each. Typically, I get accosted by companies wanting free editorial promotion in exchange for a giving away a couple of boxes of software, so I'm very pleased that NaSa is delivering some real value to APC readers.

Since there is a grab bag of write once and rewriteable DVD formats, it's always a good idea to look for upgrades to your DVD burner which may make it more compatible with a wider range of media. You can do this with firmware upgrades released by the DVD manufacturers. We've collected 87 upgrades and put them all on this month's cover CD — we even show you how to install them in just 84.

For the really adventurous, we also explain how to speed up your DVD burners (also on page 84). This isn't rocket science, but things can go wrong during the upgrade process, so a word of warning: if anything goes seriously awry you will probably void your DVD drive's warranty. But we know some of you like to push the boundaries, so we'll show you how to do it — we're assuming that as power users, you occasionally like to take these risks.

Need to Know

News, views and analysis from the IT world

Who can stop the music?

iPod users are being reassured about music copying, but in reality, laws are getting tougher. **Dan Warne** reports.

One-off copies of music CDs for playback on your PC or portable MP3 player won't land you in jail, but don't even think about copying that commercial DVD. That's the mixed message consumers could be hearing as tougher US copyright laws collide with local debate.

Despite efforts to allay fears over digital music copies for use on iPods, the introduction of new restrictions looks like complicating issues anyway. Under new anti-copyright circumvention provisions outlined in Australia's Free Trade Agreement (FTA) with the US, both the distribution and use of any technology that gets around copy protection will be illegal in Australia. This refers to the anti-copying technology found on some music CDs, as well as the encryption on commercial DVDs.

The trade pact also makes it illegal to strip digital rights management information from a song purchased from BigPond Music in WMA format and then convert it to MP3 or AAC format for use on an iPod, for instance. Previously it was only an offence to supply or install tools for circumventing copy-protection technology.

Linux advocacy groups are alarmed that open source DVD players will become illegal, and Xbox and PlayStation modders who have been generally supported by the Australian Government until now will lose the right to modify the hardware they own.

But while FTA changes will outlaw copyright circumvention, the message from the local music industry over personal copying is more reassuring. "Journalists ask! whether the copying of music to play in the car or at a party is what the industry is

seeking to stamp out, but of course, that is not our main concern," said Stephen Peach, head of the Australian Recording Industry Association (ARIA).

Peach said the industry was working on new copy control initiatives that would permit music buyers to make a limited number of copies of music they purchase, allowing them to listen to music "in a variety of ways without saying, 'Just go for it, copy as much as you like'."

However, he fell short of advocating a change in the law to accommodate personal copies for use in iPods and other devices, saying mass copying would then become a "free-for-all".

"I don't hear people clamouring for a change in the jaywalking laws, simply because no-one gets charged for breaking them any more," Peach argued. "In 40 years of home taping, we've never sued anyone for making a music tape for their car."

But others argue that the issue is far from resolved and call for a change in laws to cover personal copying of music CDs for playback on MP3 players.

Anne Flahvin, copyright adviser for US law firm Baker & McKenzie, recently told a Sydney symposium there is a "glaring" difference between Australia and the US on personal copying and said it was "concerning" that the FTA made little effort to resolve this. "In an age where every second teenager — and lawyer — sports an MP3 player, the law is looking increasingly ridiculous," she concluded.

Australian law only permits the reproduction of copyright material when it's predominantly for study or review purposes. A parliamentary report

Copy confusion: some argue digital music copying is still a legal grey area.

Consumers overseas are having success with the "fair use" argument

APC readers have their say.

30 Watchdog

Major headaches still exist for DSL-switchers.

Dial 0 for virus scan

As if the problem of viruses on PCs wasn't bad enough, mobile phone users are now also facing the prospect of downloading and updating antivirus software.

In the wake of the widely-reported Cabir virus, said to be the first type to target mobile phones, virus scanners for phones have begun to appear. Symantec, McAfee and Fsecure are among the established firms working on products.

APC spoke to Simon Crean, the managing director of Australian company Jamanda, which not only has antivirus software for Nokia phones in the works, but also antispam, backup and a phone firewall.

"We've been waiting to raise money for a year, and the first question [from potential investors] was always, 'Are there any viruses out there?'," said an excited Crean during the post-Cabir frenzy. At least someone's happy.

William Maher

The real power game

Hardware

Are speeds for new PCI Express boards all they're cracked up to be?

Power-hungry PC owners considering new PCI Express motherboards would do well to check the fine print — beneath the long lists of onboard features like super-fast networking and multiple hard drive arrays lies a considerable catch.

Rather than actually eliminating speed bottlenecks, some of the new PCI Express boards tested by APC's Labs team have succeeded in adding new ones. Depending on the devices attached to the board and the amount of bus time they use, peripheral performance may be no better than using a previous generation board.

A good example is Gigabyte's GA-8ANXP-D, though the problem applies to some boards from ASUS and other 1915 or 1925 boards. While the Gigabyte's feature list looks impressive — two Gigabit LAN ports, eight USB 2.0 ports, two FireWire 800 ports and eight Serial ATA ports — only one of the Gigabit Ethernet adaptors is on a PCI Express interface. While this adaptor might operate at top speed, the other onboard ports will be throttled back through the slower 133MB/s PCI bus. So much for blazing speeds.

The bottleneck is caused by manufacturers adding too many onboard features. Both 1915 and 1925 boards have a maximum of 20 PCI Express lanes

Bottlenecked: traffic on PCI Express boards can still snarl up.

available, of which 16 are used for graphics, leaving a maximum of four for other peripherals. The problem is that boards such as the Gigabyte have reserved three of these lanes for PCI Express x1 slots for external plug-in devices, leaving room for just one onboard PCIe controller. The remaining onboard features, from FireWire ports to hard drive arrays, then run through the slower PCI bus.

This doesn't mean new boards will run any slower than the older technology. But if people are expecting PCI bottlenecks to disappear, they'll be mistaken unless they choose their boards carefully. It's a lesson in what can happen when marketing hype overrides commonsense engineering.

William Maher and Jarrod Spiga

► Who can stop the music?

previously recommended bringing this into line with the US policy of "fair use".

Australian Democrats IT spokesman Senator Brian Greig supports this view. "I'm not advocating that you should be able to buy an original of something and then mass-produce copies," he said. "But it seems peculiar that if somebody buys a CD and then puts it on their iPod for their own use that should infringe copyright."

Meanwhile, consumers overseas are having success with the "fair use" argument. As a result, Hollywood is piloting a new DVD specification that will allow consumers to make a limited number of legal copies, and the US Federal Communications Commission has approved the right of owners of TiVO personal video recorders to share TV recordings over the Net with up to nine others.

Both technologies are designed to stem the flow of what the industry has labelled

"indiscriminate copying" over the Internet. They give consumers easy-to-use technology for copying with built-in limitations which they hope will become more popular than the relatively difficult methods currently used by movie pirates.

But Music Industry Piracy Investigation head Michael Speck said Australian consumers shouldn't expect the legal right to rip CDs they own into iTunes anytime soon.

"If you want to buy music and make a series of copies, you can do that. What you do is go to a legal download music site and you buy it. The argument [that intellectual property laws will have to change to accommodate CD copying] is specious. It's driven by people who don't pay for the property and are running businesses based on breaching copyright, who rely on the fact that the consumer won't undertake the grand analysis of the difference in products.

"If you buy a CD, you buy a physical

product that allows you to listen to the music contained thereon," Speck continued. "If you buy a legitimate download, you buy the right to download that music and store it in a music player and in some cases make a limited number of copies to approved formats."

Your new MP3/DVD rights

- No "fair use" right to make copies of CD/DVD for personal use, even if you own them.
- Illegal to distribute or use any copyright circumvention device. This includes watching DVDs on Linux or modifying an Xbox so that it can play games bought in other regions.
- Illegal to remove digital rights management information from a file.

Information correct at time of writing.

Chat

Email, voice now linked

Combining voice, chat, email and instant messaging is now a reality. Soon, they could all be linked via one catch-all "Internet telephone number".

"Voice over IP is dead, get over it," is a strange comment coming from a man who makes his living from pushing next-generation telephony. But according to Mick Reagan, Nortel's chief convergence architect, the real future lies in all-in-one communications services, a concept that is poised to become reality in the near future.

Reagan is behind Australia's first commercial all-in-one communication service, designed to simplify the headache of keeping track of a flood of instant messages, voicemails and emails.

The Optus service, called IP Centrex, will "find" you wherever you are — on mobile phone, SIP PC soft-phone or even Instant Messenger. End users can set their "presence" in the software, stating how they would prefer to be contacted at any given time, and servers at Optus exchanges running Nortel software interact with your PC to direct your messages.

Optus' service is not cheap. At about \$300 per end user per month, it will only appeal to small businesses wanting to avoid the cost of installing and maintaining a PBX and videoconferencing equipment. But similar, more advanced systems are already being planned for consumers.

The authorities that control the structure of the Internet are already working on implementing a universal address called "eNum", based on the e.164 Internet numbering standard. The concept is simple: each individual will have one number for all forms of communication, and the Internet's domain name services (DNS) will switch through to the appropriate end-point depending on the method of communication being used. The tagline being used to describe the system is "Telephone number in, URL out".

It aims to do away with separate email addresses, phone numbers, SIP Voice over IP identifiers, Web site addresses and IM IDs — one eNum identifier will be used for all of them. The proposed eNum standard calls for the use of telephone numbers in reverse as these provide an existing worldwide index which has an internationally agreed numbering scheme.

An Australian taskforce has been appointed, led by the Australian Communications Authority, with the aim of bringing government, Internet authorities and telcos together to produce a one-size-fits-all communication system.

However, the system may be several years

Outlook calling: all-in-one communication blurs the line between voice and real time messaging.

away from going live because of policy issues that need to be worked out, said Australian Domain Authority CEO Chris Disspain. For instance, people might not want to disclose their phone number whenever they give out their email address. Then there's the problem of person-to-person communication using shared phone numbers.

Even without a formal eNum system in operation, developers are rapidly bolstering instant messaging clients with enhanced voice capabilities. PhoneGAIM runs on Linspire Linux, offering instant messaging, voice telephony using the SIP protocol, voicemail that allows others to leave you messages when you're not logged on, and the ability to call "real" telephones at a much lower cost than using a regular telco.

Dan Warner

Phone book of the future

Taste real time communications yourself by registering your phone number at e164.org (www.e164.org). People using compatible software (not common) will only need to remember one number, whether they're calling you on a landline phone, via Voice over IP, sending an email or adding you to their instant messenger list.

Is it legal. . .

. . .to use Windows accelerators?

Creators of "accelerators" claim to actually be capable of boosting your PC's performance. A utility called Hare claims performance gains of 300%, though technical information is sketchy at best. The Web site claims Hare's features include an "88-bit kernel" for accelerating common system instructions, plus memory defragging and CPU tasking. Registry hacks are often used.

Microsoft says people should "leave the registry alone". But it stopped short of forbidding it outright, adding that anyone altering the registry should back up their system first. Don't say you weren't warned.

Disclaimer: this does not constitute legal advice. Check with the appropriate legal authorities if an issue specifically concerns you.

Next-gen wireless

It's called Adaptive Radio, and if Intel's vision proves to be accurate it may one day allow wireless users to forget about the confusing jumble of standards, speeds and encryption mechanisms.

Intel is reportedly planning radio chips that can skip between frequency bands, detecting and adjusting to available networks, rather than searching for one pre-programmed signal.

Eventually, it's hoped that wireless chips will connect across the plethora of different signals in the air. A laptop equipped with such technology could potentially connect over Wi-Fi in airport lounges, 3G networks in cities or the emerging WiMax standard over longer distances.

Underground MP3s

Services such as Kazaa may still be operating in the face of legal action, but elsewhere there are signs that file traders are returning to their underground roots.

P2P software developers are aggressively pushing ahead with moves to make people using their software more anonymous. Pablo Soto, developer of the P2P protocol that forms the basis of Blubster, Piolet and RockitNet, claims the latest version will mask users' identities.

"If other means of delivery could be compared to a postal system, with an identifiable sender and receiver, then Blubster's proprietary MP2P network could be likened to throwing a bottled message into the vast ocean," he said. "The message may get to a destination, but no-one knows the full path of its journey, nor what is in each bottle."

While the software puts significant roadblocks in the way of investigators, Soto defends MP2P, saying it uses three separate layers of protection: true peer-to-peer transfer with no central servers, fully encrypted communication, and a mix of TCP and UDP communication to make monitoring a single data stream more difficult.

Other networks disguising users include Earthstation 5 and Filetopia. Methods include the use of proxy computers.

The trend follows a legal settlement between peer-to-peer service iMesh and record companies. iMesh said it is working on new technology that will enable users to "find and share content... without the fear of being sued."

Meet the man in the front line of the battle against domain name fraud.

Thousands of Australians have lost money to Internet domain name scams, particularly those who registered domains through Domain Names Australia (DNA). We put some of the most common complaints to Chris Disspain, CEO of the Australian Domain Name Authority (auDA).

What's the progress on getting money back for Domain Names Australia victims?

DNA has appealed to the full bench of the Federal Court. Our message remains firm: we are committed to getting a result from the court stating that DNA's behaviour isn't acceptable so we can proceed with a class action in order to get money back to consumers.

How can a domain registrar afford to fight a drawn out legal battle?

Very simply — 9,000 people paid them \$237 for a domain name which in many cases hasn't been registered yet. There's an awful lot of cash there for a fighting fund.

What lessons have been learnt from the DNA saga?

The biggest lesson for us is that we need to educate small business and the public about auDA and the code of practice around domain name registrations.

auDA isn't a government body — we can only "govern by contract". Unfortunately, DNA was just buying domains like any other person "walking in off the street" and then reselling them. It wasn't a contracted and accredited registrar.

Entities such as law firms, accountants and ISPs can legitimately manage domains on behalf of customers without necessarily being accredited — DNA is the only company we've had problems with. If it became a growing problem we would go back to government for a legislative solution.

Why do Australian domains cost so much when you can buy .com domains for about US\$7?
Actually, Australian domains aren't that much more expensive than their .com equivalents. A

Microsoft's hardware game plan

Microsoft looks to strengthen its influence on PC hardware makers.

If the latest plans of the self-proclaimed "worldwide leader in software" are any guide, Microsoft is working harder than ever to boost its links to hardware makers.

The company recently unveiled a plan to sell hardware directly from within Windows. Dubbed Windows Marketplace, the program will embed a link to a software and hardware sales site directly into the Windows XP Start button and Internet Explorer. Significantly, products which meet the requirements of Microsoft's "Designed for Windows" program will be separated from other products and given an extra promotional push.

In effect, Microsoft will use the incentive of extra sales to encourage hardware and software developers to follow its certification schemes. "The ability to identify products that have received the 'Designed for Windows'

Microsoft? Bill Gates attempts to sharpen his focus on — and influence over — hardware manufacturers.

logo has been shown to have a positive effect on customers' intent to purchase," a message promoting the program noted.

A spokesperson told APC that Microsoft has no immediate plans to implement the Windows Marketplace scheme in Australia, so local users will just have to put up with the redundant links to the Marketplace site that

will be embedded within the new software. However, if the model proves a useful source of revenue for Microsoft it is likely to hit these shores eventually.

The screws are tightening between PC makers and the operating system supplier. The need to control design in the console market led Microsoft more directly into hardware with the Xbox. More recently, Microsoft released Windows XP Media Center Edition in the US, which is bundled exclusively with specifically designed PCs from brands such as HP, Acer and Toshiba. One persistent rumour suggests that Microsoft will be applying even tighter certification rules for hardware passing the Windows Hardware Quality Labs (WHQL) process in Longhorn.

Microsoft's longstanding alliance with Intel has been hugely beneficial to both companies. However, Intel now has the advantage of an alternative operating system that's also optimised for its processors in the form of Linux, a factor which has changed the balance of power between the two companies. Working closely with other vendors will help Microsoft retain control over hardware elements, a model it is already successfully applying with Media Center PCs.

Microsoft's bundle-and-control approach has been the target of frequent criticism. But integration continues to bring benefits to consumers according to Brian Prentice, a senior analyst at META Group. "If nothing was ever rolled into the operating system we would still be buying word processors based on who had the best print drivers."

As Microsoft looks beyond Wintel, that influence will be stronger than ever.

Angus Kidman

Interview

.com name will probably cost you US\$12 a year. That's roughly \$18, or \$36 for two years. In comparison, a .au domain name is \$60 for two years with the cheapest registrar, so it's not a huge price difference in dollar terms.

Domain names in the .au space come with protections you don't get anywhere else in the world, and which are actually policed. If you go to a .com.au domain name, you can be assured it is owned by an Australian business or related to an Australian registered trademark. The chance of typing in "shares.com.au" and going to a porn site is negligible.

Who gets the money from a .com.au registration?

Let's take a median example — \$90 for a two-year .com.au licence. Of that, \$75 goes to us, \$30 to the company that operates the registry, and the remainder (\$52.50) to the registrar.

That still sounds like a lot of fat. Most people would find a \$10 .com domain name pretty attractive for personal use compared to \$60 for a .com.au domain. People wouldn't be registering a .com.au

domain for a personal use though, because they're for companies only. They would be registering an .id.au domain, which is about \$25 for two years if you shop around. There's not a lot of publicity about .id.au at the moment, but it's building.

Is the issue of companies snapping up expired domains a growing problem?

It's actually as difficult as it possibly can be for people to deliberately buy up expired domain names. We don't publish expired names, nor expiry dates, on individual domain records.

Shouldn't it be harder for people to forget to renew their domain?

It's crucial people realise it's their responsibility to renew their domain, just like their driver's licence. After email and postal reminders, domains go into a "pending delete" mode for two weeks where anything linked to the domain — a Web site and email server for example — will stop functioning. At the end of that, the domain name is randomly released into the pool over the next 21 days.

Chris Disspain spoke to Dan Warne

"There's no doubt the prospect of Linux gave Microsoft a shake"

Telstra's Ted Pretty explains how the telco secured a discount from Microsoft for a massive new upgrade deal to its 40,000 PC network. If only everyone else could be so lucky.

(Source: *The Australian*)

Code reboot for Linux

Can the Linux file system adapt to compete with Longhorn?

It sounds like the coding equivalent of a practical joke, but for some Linux advocates the "dancing tree" algorithm represents a possible basis for a future Longhorn-conquering file system.

The algorithm is the key to the Reiser4 file system, which its creators claim will enable the speedy management of millions of files. Some even argue that it could be used as the basis for an attribute-like system, a search concept behind both Longhorn and Apple's Tiger operating system.

Implementation details differ, but both Longhorn's WinFS file system and Tiger's Spotlight make navigating and searching for files easier by using a network of simple attribute pairs — such as creation date, file type or content keywords — assigned to each file. File systems move from their current simple flat file structure and take on a complex relational approach. It's a challenging developmental task, but one which offers much greater flexibility.

Pressure is now building from some areas within the Linux community for a similar file system, with some claiming Linux's future ability to compete is at stake. As Mark Stone put it in a commentary piece at Linux.com: "If Linux is really to compete on the desktop, and if it's to advance its hold in the server space, it must enter the search wars, and do so at the file system level."

Compared with current flavours of Windows, Linux can support a wide variety of existing external file systems (mostly derived from the Unix world). Despite that versatility, it doesn't offer a true

Back to basics: Is Linux ready for a Longhorn-like file system overhaul?

attribute-driven system. That doesn't mean developers haven't already attacked the problem. Several projects exist which cross into file indexing and advanced searching, including the Gnome Storage project. A comparison of some of these can be found at www.gnome.org/~seth/blog/document-indexing.

However, making the issue a high priority is proving difficult for the open source community. At the recent LinuxWorld conference, protecting Linux from copyright and patent lawsuits such as that filed by SCO was still the most prominent talking point.

The argument that the battle might be better fought elsewhere, because technical superiority alone hasn't always assisted Linux, carries some weight. For instance, an Evans Data survey in July found that 92% of Linux developers have never been infected by a virus, but such data has made little difference to the uptake of Linux.

P2P music on your phone

File sharing software that's not only legal but can earn you money?

Walk down the street with a Bluetooth-enabled MP3 player and you could receive a text message that someone nearby shares your taste in music and would like to download a couple of your favourite tracks. Sounds far-fetched? Not any more. Melbourne company AgentArts (www.agentarts.com) is bringing music sharing to mobile devices.

Dubbed IcyPole, the "recommendation" software should be available for download by year's end. Better still, AgentArts is investigating payment methods and copy protection systems, so this P2P play has the potential to earn you a few cents every time you help record companies by distributing their tunes.

The hard drive acid test

Hard drives can survive fire, drowning in beer and getting run over, but there are still ways of getting rid of data for good, as **Angus Kidman** discovers.

Inside info

- Recovery software

If you're going to murder someone, it's not a good idea to do so while a Webcam is filming the incident. Faced with this problem, one killer took extreme steps to destroy the evidence. After prying the hard drive out of a notebook with a crowbar, said killer twisted the platters beyond recognition with pliers, then threw the drive in a swimming pool for good measure.

"I don't know why they didn't just take it with them and throw it in a bin," muses Brian Nestor from Precise Data Recovery Services (PDRS), who was sent the mangled drive by an Asian police force who wanted to know if the data could be recovered. The answer in this case was no, so the murderer's goal was accomplished. But it was a risky endeavour.

While we're accustomed to thinking of hard drives as fragile creatures, data recovery

experts can retrieve data even in situations which would at first appear hopeless. PDRS successfully retrieved data from a notebook which had fallen into a bath while in use. "Who knows what he was doing with it in there," says Nestor with a laugh.

Non-disclosure agreements prevent Nestor discussing many of his more interesting cases, but he does mention one international military client that managed to drop a notebook out of a helicopter and onto a submarine. (The data was retrieved in that instance.)

Data recovery companies can handle a range of situations with aplomb (see "Would your drive survive this?"). Yet most drive failures, and the consequent risk of data loss, are for more mundane reasons. "The most common scenario is that the hard drive PCB is blown by a power surge," says Guy Riddle, manager of the Sydney office of CBL Data Recovery.

"The second most common is that the internal workings of the drive go wrong," he

Would your drive survive this?

We asked recovery experts **Guy Riddle** and **Brian Nestor** for their assessment of four extreme scenarios.

FIRE

Recovering data from a drive that's been in a fire is straightforward, if painstaking. "Very rarely would a fire be so bad that the platters are damaged beyond repair," says Nestor.

"It depends on how long the machine has been exposed and what temperature it has got to," says Riddle. "If it's got so hot that it's melted everything, there's not much you can do. Generally, we rebuild one drive from

another drive. It's not uncommon for us to have to vandalise another drive to get the head assembly working again."

WATER

"Drives are pretty resilient, but they're not completely waterproof," says Riddle. "We have to disassemble the drive and use a special high-quality cleaning fluid to remove any residue. When we reassemble it, we have to ensure the read-write heads don't come in contact with any particles."

"It's not problematic, provided the client doesn't start up the drive," says Nestor. When asked to fix 34 drives which had been subject to flooding in Katherine, NT, the only drive PDRS was unable to fix was one the user had opened before sending it in.

CRUSHING AND FALLING

Nestor and Riddle agree: "If the platters are intact, we should be able to recover the data."

"We occasionally get notebooks that have been knocked off the table," says Riddle. "When they hit the floor, the read-write head will either scratch or chip away a piece of the magnetic coating. That requires a bit of work."

INDUSTRIAL MAGNETS

For total data destruction, it's hard to beat magnetic fields. "A strong enough magnetic field around the drive can make it impossible to recover the data," says Riddle.

Fortunately, magnetic fields of that strength are uncommon outside the specialised degaussing machines employed by data destruction professionals. "I don't think there are enough of these machines for common usage," says Nestor.

continues. "In either scenario, you can't use conventional recovery tools or software."

Physical damage isn't the only potential hazard of storing data on hard drives. Personal data can also be readily retrieved from junked machines. Software designed to help users recover data deleted through accidents or malicious code can also be deployed to locate information on stolen or second-hand PCs. For instance, two students bought 158 pre-owned drives on eBay in 2003 and uncovered personal information on 28 of them.

Mind you, this sort of behaviour — and even some relatively mundane activities — can put you on the wrong side of privacy laws. Nestor points out that, in theory, no drive containing personal information can be sent overseas, even for warranty repairs because to do so would violate national privacy principles concerning cross-border transport of data.

THE CONCEALED OS

So, if throwing a drive from a helicopter can't effectively get rid of personal data, what can be done to effectively erase it? Specialist software packages provide one possible solution (see "Is your data really gone?"). However, to ensure that data remains as confidential as possible both while you're using it and when you decide to get rid of it, changes are required at the operating system level.

Different operating systems vary in how readily they allow you to dispose of data by

overwriting it with new information. Unix comes up looking good in this picture. "If you purposely erase something, Unix makes the space available for immediate rewriting," says Nestor. "Windows is more random."

Unix is also being used as the basis for "anti-forensic" file system approaches, which are designed to be more resistant to probing by curious parties. In a series of presentations across the world, a hacker known as "grug" outlined three core principles for working with data in a way that makes it hard to trace.

The first of these is data destruction, which involves deleting and overwriting data as soon as it is no longer useful. Then there's data hiding — storing data in formats and locations that aren't obvious, as well as using encryption techniques. Lastly, data contraception means keeping data in memory as much as possible and only accessing it with standard tools, making its presence less obvious.

These approaches are undoubtedly overkill for most individual users, but could prove useful to large corporations more concerned with maintaining privacy than audit trails, as well as appealing to the hacker community.

Despite such advances, safeguarding our personal data is likely to remain a problem as long as we maintain the same sort of lackadaisical attitude to deleting unwanted data as we do to backing information up. As Riddle points out: "People are just as slack as they have always been." **ITW**

Is your data really gone?

You don't need to be criminally-minded to want to completely erase your hard drive. Anyone hoping to sell or redeploy an existing drive is advised to wipe existing data, but what methods are available?

Formatting a drive is of little practical use, since existing data won't be removed until new information is written over it. A low-level format, which replaces the manufacturing information on sector layout, makes it harder to track down old data, but the only way to ensure that data is permanently erased is to overwrite every sector multiple times with random data. Tools which can help accomplish that task include DBAN (<http://dban.sourceforge.net>), available as an open source product, and commercial tools such as R-Wipe (www.r-wipe.com) or SecureClean (www.whitecanyon.com).

Such an approach is only worthwhile if you do it thoroughly. "Most of those programs only do so many bytes and leave the rest," says Nestor. "Nobody wants to take the 12 hours needed to do a 60GB drive."

To completely erase data, you could also get a specialist to place the drive in a degaussing unit and completely magnetise it — a speedier but more costly alternative.

DVD's burning question

Don't hate the copyright police — they're not out to get iPod users. But that doesn't mean they support a tax on blank media.

Imagine a world where car thieves develop or adopt a new technology that allows them to steal a car whenever they want. What do you think is the last thing car owners, car manufacturers and governments are going to do? Even with the most economical application of commonsense they won't be creating a new tax on cars to accommodate this phenomenon.

However, if copyright is being stolen or misappropriated — that is, digital music via the Internet — the prospect of a tax to compensate the victims rather than fixing the problem is passed off as plausible.

Proponents of the so-called "blank media levy" rely on variations of three propositions to justify its imposition, but they all boil down to the idea that private copying of music is out of control and uncontrollable, and therefore some money should be made from it.

This ought to offend anyone with an interest in technology or intellectual property rights. If you're inclined to accept this proposition, you have to ignore a great deal of information and not question much of what the levy's proponents offer up by way of explanation.

CHANGING FACE OF PIRACY

To suggest that the exchange of music on the Internet or private copying is out of control is preposterous. Granted, the music industry has had to struggle to compete with pirate operations in the online environment, but with the emergence of legitimate online music services this is clearly changing. If the terror of online anarchy doesn't convince, then you are told that technology will never control online piracy or private copying. This only works if you have no faith in the technology and you can overlook the amount of control needed to pursue or administer the levy.

Of course, with the fear argument comes a dose of loathing because you'll very quickly be told that you can be prosecuted for private copying. Ignoring the obvious fact that the person or organisation telling you this has nothing to do with the copyright owner and therefore cannot make this statement with any credibility, I can assure you, as the head of the Australian Recording Industry Association's (ARIA) anti-piracy unit for the past decade, that no-one gets prosecuted for private copying — as a rule we only prosecute infringers whose activities are significant.

Finally, proponents of a levy suggest it offers some compensation to copyright owners. Well, those copyright owners would rather make money from the sale of their products than accept a smaller amount from the theft of them. In fact, it's impossible to think of a business that would prefer this sort of arrangement!

What you are not told here is that a levy means additional costs to consumers and not cheaper products. Further, a wide variety of blank media products are not used for storing music or other forms of entertainment.

We live in a world and engage an online environment where technology moves so fast

that people suffer acronym fatigue. Perhaps the solution for illicit online activity is the next generation of compression technology, User Datagram Protocol, Transmission Control Protocol or some hybrid of all three — we can only wait and see.

That solution won't come from any legislation or impost that legitimises the illicit activity or obscures the difference between legitimate and illegal activity. Blank media taxes and other legitimising activities that online pirates rely on to generate their revenues, such as private copying, shouldn't be part of the legislative framework in the digital age as they can't properly encourage its evolution. *Michael Speck is general manager of Music Piracy Investigations (MPI), which has been involved in anti-piracy investigations of Kazaa.*

Mary Jo Foley

Bloggers "R" Microsoft?

No wonder there's a blogging frenzy at Microsoft — the software giant has a history of missing street buzz about new tech.

Over the past couple of years, the number of Microsoft employees who are also bloggers has jumped from just a handful to more than 1,000. And according to my sources, word is that chairman Gates is sharpening his virtual pencil in preparation to become chief blogging architect.

This blogging wave is washing over the company just in the nick of time. Until fairly recently, Microsoft — in spite of being the world's largest software company — has been lagging behind major technology trends.

In the past — in search, gaming and the Internet, to name but three examples — it took an 11th-hour call to action by a persistent (and fearless) Microsoft techno-watcher to convince the company's top brass that it was about to miss the boat. Only then did Gates and/or CEO Steve Ballmer issue a major course correction. (Remember Gates's "Internet Tidal Wave" memo in the mid-1990s, anyone?)

Microsoft has always been a company run from the top down, and the cults of Bill G and Steve B are quite strong. Relatively few employees were willing to rock the corporate boat, even in the name of doing the right thing by its customers and partners.

But more recently, Microsoft's leadership has come to acknowledge that the company is out of touch with its customer and partner constituencies. In spite of valiant and often somewhat successful programs such as the Microsoft Developer Network (MSDN), the company's been accused by many developers, OEMs, resellers and customers of being arrogant, uncaring and unapproachable.

To remedy the situation, executives have been desperately seeking new ways to reach out to these disenfranchised groups. Blogs are ideal in this respect because they provide an unparalleled level of transparency and interactivity. Do you want to know what your customers and partners want? Simply ask them and they'll reply, early and often, via the comment section on your blog.

This Microsoft blogging phenomenon is no fad, and that's downright astounding. And it just might end up pulling Microsoft's head out of the sand.

As Editor of Microsoft Watch (www.microsoft-watch.com), Mary Jo Foley is one of the world's most prominent longtime Microsoft pundits, covering the software giant since the early 1980s. Each month Foley sounds off exclusively for APC on Longhorn and more.

Why Microsoft is still a monopoly

Ziggy Malter, I'm absolutely flabbergasted at your black and white views and lack of research (APC August, page 31). You don't need to have the full 100% market share to be a monopoly.

Microsoft Windows runs on approximately 90% of desktop machines. Of the remaining 10%, Apple take up less than 5% of the market and the rest is a mix of other operating systems, including countless versions of Linux.

There is only one company that controls most of the market and it is regularly shown that companies do whatever Microsoft wants because they need to get their product to 90% of users to make the most money.

The reason Microsoft would have to give up some of its code is because its dominance in the market, or monopoly, means that rival companies have no ability to fairly compete against it. Just take a look at what was going on before governments around the world started taking action against Microsoft (for anti-competitive practices). Windows *had* to be shipped with machines exclusively, meaning people *couldn't* get a machine installed with another OS at purchase time.

Most users don't understand what an OS is or what the alternatives are, so they certainly won't be asking for Mandrake pre-installed. Internet Explorer used to be, and in reality still is, totally integrated into the OS. Other browsers were unable to utilise a lot of the features that Microsoft had added in the way of OS/browser integration because it was using application programming interfaces only Microsoft knew about.

As for Ziggy Malter's assertion that Apple has a proprietary product and forces its users to use its operating system, take a closer look. Apple is running a Unix-based operating system. Its underpinnings, Darwin, are freely available to the open source community. Apple contributes vastly to projects such as the KHTML Web rendering engine which is used in Safari, with all of that input given back to the KHTML developer/user community.

Many times I have compiled source code written on a PC Linux machine on a Mac OS X box, and the other way around, but you can't take source code written for Windows and compile it on another platform. Why is that?

Adam Rice
Red Hill, Qld

Go directly to jail: do not collect \$2 billion.

NO MIRACLE VACCINE

Richard Leahy's suggestion that ISPs should be made responsible for virus control (APC August, page 30) is ridiculous!

We are a small, rural ISP with approximately 1,400 customers. Since the day we opened we have absorbed the \$3,000 annual cost of running virus-checking software on our mail server. Simultaneously, our monthly data costs have been rising constantly due to virus and

Letter of the month

MODEMS OF THE FUTURE

I bought an internal 56K modem, an internal ADSL modem and an internal TV tuner card, each of which was reputed to work under both Linux and FreeBSD using open source drivers. Three devices and two OSes made six combinations. My success rate: 0 out of 6. So I got to thinking.

It's easy to set up an external 56K serial modem under Linux because it doesn't need a driver, only the PPP configuration files (see the iNet support page at www.linnet.net.au/support/linux/index.html).

An internal modem would behave similarly if it worked through an on-card serial port. Indeed, such modems were manufactured until quite recently. But they seem to have been discontinued.

Likewise, an external ADSL Ethernet modem needs no driver. In fact, if it also includes built-in PPPoE/PPPoA clients and a DHCP server, it needs no modem-related software at all: you point your browser at the local IP address of the modem, fill in the form,

save it, reboot the modem, and thereafter it just works.

So I reasoned that an internal ADSL modem interfaced through an on-card Ethernet port would likewise work without a driver under any OS. It could even be cabled to an LED panel mounted in a spare drive slot for maximum visibility. But apparently nobody makes such a modem.

As for the TV tuner card, I can't help noticing that a PATA or SATA DVD-ROM drive plays DVD videos under multiple operating systems using standard multimedia software. As a result, a TV tuner will work with multiple operating systems if it connects to an IDE port and emulates a DVD-ROM drive. If it also occupies a drive bay, it will be ideally located for remote control. But, once again, it seems that nobody makes such a tuner.

On balance, these "IDE TV tuners" and "PCI Ethernet modems" could be price-competitive with their external counterparts. They would also be neater and enjoy compatibility with all operating systems.

Why haven't the hardware manufacturers thought of this approach to compatibility?

Gavin Putland
West End, Qld

We think Gavin's suggestion for reducing the complexity of hardware compatibility is fantastic. If you're a hardware engineer, tell us if his ideas are feasible by emailing epinions@apcmag.com. For his creative thinking, Gavin wins our letter of the month prize: a Logitech Cordless Desktop LX 700, valued at \$199.95.

spam traffic. These are also costs which we cannot recoup from our customers.

While we and many other ISPs agree that we should provide virus protection as an everyday part of our service, it isn't fair or right for people like Richard Leahy to say that we should be prosecuted for not doing so.

Viruses are a problem for everyone — you can't lump the entire blame on one group. It's impossible to deliver a usable Internet service which is completely protected against all current and future viruses.

If all ISPs had email virus checking on their servers, a lot of the viruses would disappear. But not all. Like any technical challenge, crackers would simply find another weakness to exploit and jump on the bandwagon.

The solution to the problem is education, and that starts with the retailers selling the computers in the first place. All computers should be sold with at least minimum virus protection, spam removers and all Windows security patches installed. And customers should be informed by the retailer on how to keep their system secure and antivirus products up to date.

Why do I think this? Because not only are we an ISP, we are also a computer retailer. We won't let a new machine out of the shop without all of the above being done, even though it takes a couple of hours per machine to set up. We can sleep at night knowing that it has gone out of our shop in the best possible shape. If something happens after that, like a virus, then we reinforce the importance of updating and usually it doesn't happen a second time.

Deb Youle

Waterfront Computers & Internet Service
Crows, Vic

CRASHTEST, DUMMY!

I read with some interest the editor's column in August's edition of APC. I would disagree a little when it comes to the readership trusting your reviews of products.

Over the last year I have been a little disappointed in some of the reviews I have read, specifically those relating to wireless routers and large network cards.

In the router test, many units were given good reviews as they had features such as MAC filters and port redirection. One of the units reviewed was a D-Link model. It didn't receive a good review due to, apparently, a lack of features. I have used the D-Link units a number of times and I've been wondering whether the reviewer clicked on the Advanced menu.

In your notebook test all judgments seem to come down to how fast the units run. Fast,

cheap notebooks get good ratings and slow, expensive notebooks get bad ratings. Although this may seem like a small consideration in a notebook purchase, I would rather know that the notebook will still work in two years' time.

How about dropping the notebook from desk height a couple of times and see what happens; telling us how widely supported the notebooks are; asking the vendor to supply parts for a two-year old model and see who can; testing how well the built-in Wi-Fi antennae work; and telling us what the keyboard is like for touch typing?

When it comes to notebooks, reliability and usability rate well above speed. I have seen too many non-branded notebooks with cracked cases and screens, major brands with dead mainboards, power supplies and overheating issues. Your test didn't help me identify issues with the products in any of these respects.

APC is valuable for current news, articles on new products and technology, tutorials and an advertising index, but the last thing I get around to reading are your reviews of PCs, notebooks and other hardware as I find them to be of little value. Refocusing away from raw speed would do some good, I think.

Conrad Smith

Berowra Heights, NSW

Technical editor Matt Overington responds: I agree with some of your comments, and we're currently examining benchmark procedures and how we approach product reviewing in general.

The reason we use the benchmarking apps as a basis for comparison is because they provide a fair, even base for testing. As the notebook reviews published in APC are written by several different people, it's important for us to come up with repeatable, reliable methods for testing systems.

We get notebooks for two to three weeks, sometimes even less, so it's impossible for us to comment on how well they would work two years down the track. However, it's now standard procedure to mention the warranty terms of each product tested.

While we would love to conduct notebook torture tests, unfortunately it simply isn't possible to get vendors to agree to let us write-off a \$2,000 piece of equipment for the sake of a magazine article.

Usability comments like how a keyboard feels to the touch are highly subjective, and we focus on benchmark figures to avoid subjective and meaningless reviews. Some keyboards disliked by people with large hands are praised by others with

Agenda: Your place to vent

PC VACUUM CLEANERS

In the ongoing debate about the merits of multiple quiet fans and noisier, larger fans, I can't believe nobody's talked about the risk of turning our PCs into the inside of a vacuum cleaner bag, as well as the pleasant effects it has on drive heads.

Nothing prevents effective cooling more than a nice thick coating of dust making the volume of air produced by the fan irrelevant. If you are serious about cooling, the only simple option is to blow clean air into your PC, creating a small overpressure and making the PC leak out clean air rather than sucking in dirty air.

This is most easily achieved by fitting the outside of the PC case with a decent size 240V fan providing large volume flow, coupled with a quality filter like the ones used for respiratory equipment. The old fan in the power supply should be left in as the new fan should be dimensioned to produce significantly more air than the old extracts, hence still producing over pressure.

Leif Ekman

Cool Clean Computing
Wollstonecraft, NSW

daintier mitts. That said, we are focusing on including information on keyboard layout and spacing so readers can make up their own minds.

It's extremely difficult for us to pass specific comments on support, as we generally look at notebooks that are just hitting the market. There's no way we can comment on how well they will be supported by different operating systems in the future.

Your suggestion about testing the built-in Wi-Fi antennae is excellent, though, and we're looking at incorporating that information into future reviews.

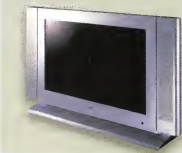

ADSL NIGHTMARE

I'm fortunate enough to live in an area of Sydney that's cable Internet-enabled and have enjoyed Optus's unlimited cable deal, which was great. But due to the monthly cost, I wanted to change to ADSL — sure it's slower, but it's still faster than a 56K modem. However, I also wanted to go with an ISP other than Telstra or Optus so I could actually get decent value for my \$30. The 200MB offered by the big two won't get you far once you install virus updates, security updates and service packs.

I applied for ADSL via TPG for my mum's house (also in my suburb) and was told ADSL

Prize Pit

The lucky winner of our August subscription prize of a BenQ DV2670 26in LCD TV is D. Wright of Dimbulah, Qld. Congratulations!

could not be provided as the phone line was with Optus. I then applied for my own house via Exetel and was told the same thing. Both Web sites have a feature that tells you if ADSL is available in your area and both came back okay. Do I have to switch to a Telstra phone to get ADSL? If so, this is absolutely ridiculous.

Australian ISPs have a lot of work to do, it shouldn't be this hard to get ADSL.

Anthony Abraham
Westleigh, NSW

APC's Dan Warne responds:

Getting broadband is definitely too complex and frustrating for many people. However, if your phone services are delivered via Optus cable, there is a legitimate reason why you can't get ADSL — it simply can't be delivered over cable, only a copper phone line.

You should be able to apply to Optus to switch you back to a Telstra-provided copper phone line. You can still get Optus phone service over the Telstra line, though it will cost a little more than getting it through Optus's own cable network. You'll then be free to choose any ADSL ISP, provided your copper phone line is within 3.5km of the Telstra exchange and doesn't have any pair gain on the line.

Unfortunately the only way to find out whether it's possible is to apply to an ISP.

Have your say

Add to these discussion threads or email your views (in less than 500 words) to opinions@apcmag.com.

All correspondence becomes the property of APC and is subject to editing. Letters sent to opinions@apcmag.com must include the writer's full name, suburb, state and phone number to be considered for print publication and in the running for letter of the month prizes. Phone details will not be published.

Then Telstra will do a comprehensive "service qualification" on your new copper phone line.

MYOB GETTING GREEDY

I read your review of accounting packages with interest but was disappointed to see MYOB awarded the gong. It's a great program but in the last 12 months MYOB has become greedy.

I have never been one to upgrade just because a new version has arrived if I can do all I want with an existing version. I was therefore rather unimpressed to discover that MYOB now only makes its tax tables compatible with the latest version.

In my small business, this is an unwarranted expense and I say shame on MYOB for getting this greedy.

Vicki Pearson
Grose Vale, NSW

MYOB Australia general manager Andrew Fiori-Dea responds:

At MYOB, we invest considerable time and effort to implement and test payroll and tax table changes in our software to ensure our customers comply with the current tax and payroll requirements.

Since 2001, MYOB has issued complete updates for payroll to ensure customers have had compliant payroll systems.

To simply add in tax tables to older versions of our product would leave customers at risk of the software not working correctly, which would then leave them vulnerable to major problems if they were to be audited, or could lead to them making incorrect payments to staff.

To ensure compliance, customers can choose between either purchasing upgrades annually or subscribing to MYOB Cover.

With MYOB Cover, we provide automatic updates, ongoing technical support and more, all for less than a dollar a day. We believe this is a cost-effective way of ensuring our customers' payroll, software and business run smoothly and accurately.

SIZE MATTERS

When reviewing laptops, you should warn readers if a crucial specification is misleading. Take 15.4in wide-screens for example. You should advise readers that they aren't 15in screens that have been made wider. Due to the way diagonal measurements work, the screens are actually smaller but wider. I'm sure a vast majority of potential buyers are unaware of that.

Rob Crombie

DSL dramas

Major headaches still exist for some DSL-switchers, warns one APC reader who couldn't change to Optus no matter how hard he tried.

Dear Watchdog,
I'm stuck in the middle of the mother of all telco stuff-ups. It's the unfortunate result of responding to a special offer of \$50 credit and 5,000 Qantas frequent flyer points if I changed my telephony and broadband to Optus.

I rang the day before the offer expired and was told that I couldn't connect to Optus DSL as I already had Internode DSL connected. Nowhere in the promotion details did it say that existing DSL customers did not qualify, or that you must have already arranged a time for disconnection with your existing provider.

After many hurried calls, I placed my order to move all my services to Optus and advised Internode to disconnect me on a certain date so I could swap DSL providers.

It took two weeks for a consultant to ring me, only to say my order had been rejected. For some reason, I was asked to reorder. A week later my long distance telephony was successfully changed over, according to an automated recorded phone message.

But despite repeated enquiries, there continued to be no progress on the DSL, and after five or more phone conversations where Optus claimed to have no record of my Internet account, I resolved to reorder.

After more delays while my line was tested again for DSL compatibility, I was advised that

the telephone account was in my wife's name and she would need to organise the DSL. I queried this, as our Telstra account is in joint names, and I had placed the order for transfer. How could it now be in my wife's name?

I was told it could not be explained and would be quicker for my wife (who was at work at the time) to authorise the change than wait a week or so for the phone account to be changed over to joint names.

Again there has been no action on the ADSL link I rely on and have been without for a week. It is now five weeks since I placed my initial order and I cannot easily go back to my old providers, Telstra and Internode, as I contracted my phone over as part of the deal.

It seems that every "customer avoidance" trick in the Dilbert cartoons has been used on me by Optus staff.

**Robert Lloyd
Seacombe Heights, SA**

Watchdog contacted Optus and asked why it had been so difficult for Lloyd to change Internet providers. An Optus PR manager responded:

Dear Watchdog,
As a reseller of the DSL service, Optus is reliant on its wholesale provider [Telstra] for the

I need an aspirin! Switching service providers shouldn't cause this much grief, yet time and again, changing ISPs is more trouble than it's worth.

provision of ports to enable a DSL connection. During May and June, our wholesale provider saw orders delayed by a shortage of ports in the DSL infrastructure they share at some telephone exchanges. This problem would not have been specific to any one DSL provider.

As soon as our wholesale provider installed additional DSL ports at Mr Lloyd's local telephone exchange, Optus successfully installed the DSL service at Mr Lloyd's residence.

Optus values Mr Lloyd's business and regrets he experienced some delay in getting his service activated. We will endeavour to improve the timeliness and accuracy of our communication to customers who may experience a "No Ports Available" delay. Optus is happy to contact Mr Lloyd to resolve the matter and avoid any issues going forward.

**Sheila Dhillon
corporate affairs manager
consumer and multimedia (CMM)
Optus**

Auctioned software no bargain

Dear Watchdog,
Recently I purchased a copy of Norton AntiVirus 2004 on eBay. Following two system crashes I managed to install the program and attempted to activate it via the Symantec telephone support number.

After a relatively short period of time I was connected to an operator who informed me that unless the software was a boxed copy with the relevant licence, I didn't have any hope of reactivating the software.

What happens if the software is included in an OEM version supplied with a motherboard? I purchased a sealed CD, with a serial number printed on the CD sleeve — it is certainly not an illegal copy.

This is not a complaint against eBay or the person who sold me the software but against Symantec. What use is bundled software if you cannot activate it?

**Wayne M Pavy
Blackwood, SA**

Dear Watchdog,
We are sorry to hear about Mr Pavy's recent experience. Unfortunately, Symantec is unable to verify the validity of software that is sold on eBay or any other unauthorised sites.

Our recommendation is that customers purchase our products from either online stores or from our worldwide network of resellers in order to avoid any risk of

inadvertently purchasing pirated software.

By using copied or counterfeit software, customers expose themselves to a number of risks including dangerous software viruses and other malicious computer code, corrupt disks or otherwise defective products, inadequate or no product documentation, insufficient warranty protection, lack of technical support, software compatibility problems and ineligibility for product upgrade rebates.

In addition, our 2004 OEM software does not have product activation, so this should not be an issue either.

**Norm Kohlberger
senior regional product manager
Symantec**

Contact us

WE WANT TO KNOW

how IT companies are really treating you. Letters must be under 500 words and include your full contact details and any product information. Write to: watchdog@apcmag.com or PO Box 4088, Sydney NSW 1028. All correspondence becomes the property of APC and is subject to editing.

Lloyd's initial problem — that Optus couldn't connect him until he fully disconnected from Internode — is the result of Optus not participating in the industry-wide DSL transfer process. Any provider that offers services over Telstra's network, including Optus, can opt to participate in the process, but Optus chooses not to. As a result, its existing customers can't as easily change to another ISP, and in Lloyd's case, he couldn't easily change from another ISP to Optus.

A list of ISPs participating in the DSL rapid transfer process can be found at www.apcmag.com/info/FastChurn.

Lloyd eventually got his DSL connection through Optus, though he had to do his own detective work.

As per its response to Watchdog, Optus told Lloyd it couldn't connect him because all the ports in his exchange were full. He contacted Internode to ask whether he could get his old service back, relaying Optus's advice that there were no ports left in the exchange. Internode advised that there were ports available, a fact he went back to Optus with, which then connected him.

"My complaint is really that no-one at Optus gave me a straight answer," said Lloyd. "There's no single department you can ring to get your problem chased up and resolved."

TARDY SERVICE FROM ONLINE RETAILER

Watchdog was contacted by two customers regarding online store I-Tech (www.i-tech.com.au) to complain about slow service.

Dear Watchdog,

I purchased a motherboard at I-Tech which later became faulty. There has been a huge delay in replacing the motherboard under warranty — over a month now. When I called I-Tech, they couldn't even find me on their computer! They then put me on hold for 15 minutes, at which point I hung up. I need my computer for my work, and this is just not good enough!

Andreas Fisher
Jindabyne, NSW

Dead pixel policy zeroed

Ian Stewart from Melbourne contacted Watchdog to query Acer's zero dead pixel policy. "The guarantee influenced my sister's decision to purchase an Acer laptop," Ian told Watchdog. "But unfortunately she didn't check the screen on pickup and when she got home, she found it had a permanent white pixel."

When Ian and his sister returned to the Dick Smith store where the machine was bought to request warranty service, they learned that Acer had withdrawn its zero dead pixel warranty prior to the date of the notebook's purchase.

Acer told Watchdog the policy had been withdrawn due to a severe shortage of LCD panels. A spokesperson said consumers were given fair notice through retail shops, where the warranty was originally promoted.

"In addition, Acer endeavoured to contact all relevant media [to advise] of the changes to the PixelPerfect Guarantee," he said.

From March 2004, the zero dead pixel warranty changed from a free part of Acer's standard warranty to an optional warranty upgrade with an associated cost. Unfortunately, Ian's sister hadn't heard of the change before she purchased the notebook.

"Acer is the only major IT vendor that offers a perfect pixel warranty upgrade and

Dear Watchdog,

On 27 May, I ordered two BenQ monitors from I-Tech. I paid by credit card over the phone and it was charged two days later. I was told categorically the monitors were in stock and would be shipped that day. Nearly two weeks later I have received nothing, even though I've already paid. I'm feeling completely duped and have to keep telling my four-year-old son he can't use his computer as the screen won't work until I get a new one.

Tiffany Hunt
Hay, NSW

I-Tech responded promptly to Watchdog's inquiries and appeared sincerely apologetic about the delays.

Dear Watchdog,

We've looked into Andreas Fisher's case and we're very sorry about this incident. We received the faulty motherboard in mid-May and only sent the replacement back to him in

two hour turnaround on notebook repairs," an Acer spokesperson concluded.

Ian says that after his sister's experience, other readers should switch on a computer or monitor before purchasing it to ensure that there are no dead/bright pixels on the display. If a retailer won't let you, take your business elsewhere.

It's fair enough for a vendor to change its warranty terms provided it publicises the change and modifies its ongoing advertising. However,

Ian's sister's experience also highlights the importance of readers clarifying exact warranty terms before purchasing an item, and preferably getting it in writing. As always, "caveat emptor" — buyer beware.

Buyer beware: check monitors and notebooks for dead pixels before you leave the place of purchase.

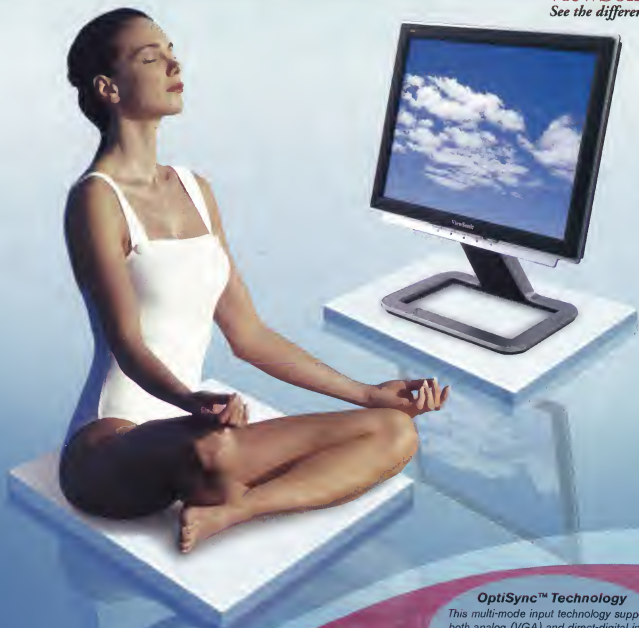

June. Unfortunately, the delay was out of our control as most faulty products are passed back to the distributor for repair or replacement. If the fault was dead on arrival, we would have sent a replacement to him within seven working days, but it wasn't the case here.

All of us at I-Tech were aware of the incident with Ms Hunt's purchase. At the time of her conversation with our sales people, we had three of the model of monitor she wanted to purchase in stock. When the invoice was processed, all three had been allocated to another customer just minutes before her order. We contacted our distributor immediately to confirm that more of the same monitors were coming into our warehouse and were assured stock would arrive the next day. Unfortunately, this didn't happen.

We have rectified this matter with Ms Hunt and sent her a complimentary gift to apologise for the inconvenience caused.

Simon Chan

Change for the better

Editor's Choice: This is awarded to the product that offers the best blend of features and performance. This product stands out above the competition as simply the best in its field. A product must score 4.5/5 to qualify.

Highly Recommended: awarded to products that don't quite make Editor's Choice, but still stand out due to a particular feature or overall performance. Any product scoring 4/5 qualifies.

Best Value: as APC hands out Editor's Choice and Highly Recommended awards based on features and performance, often there's a standout product at a low price that misses out. This award is presented to the product which falls highest above the line of expectation in the Price-to-Performance graph (see below).

At the time of writing, the APC Labs were filling up with PCs purpose-built for video editing from major brands and some lesser-known players. We're running through each machine, closely examining it for raw performance, stability, suitability for video editing, quality of components, and value for money.

Buyers of these systems will be pushing them hard every day and can't afford breakdowns, shoddy components or poor assembly. It takes several days to adequately and thoroughly test each system, but the time invested here in the Labs provides a clear picture of which machines are worthy of recommendation and which are, quite frankly, absolute lemons.

On Test is designed to provide unbiased, critical reviews of whatever software, hardware or peripheral products that interest you. Recently we've introduced the Price-to-Performance Ratio in Labs Challenges because we think it helps simplify the process of picking which products perform best, relative to the rest of the pack.

THIS MONTH'S LABS CHALLENGES

One of the most exciting aspects of working with technology is the rate of change. Technological developments are so rapid that

products can move from the drawing board to the mainstream in months instead of years.

Take ultra-portable projectors, for example. Not long ago, you needed a big, beefy machine with a powerful bulb to present in a brightly-lit environment. In fact, many corporate headquarters had a dedicated projector room, where meetings and presentations could be given in a darkened environment.

Times have changed, and 2,000 ANSI lumen projectors can now be packed into notebook bags and taken to sales presentations. Coupled with a portable screen, these units liberate offices, sales staff and trainers by giving them the ability to work anywhere, any time.

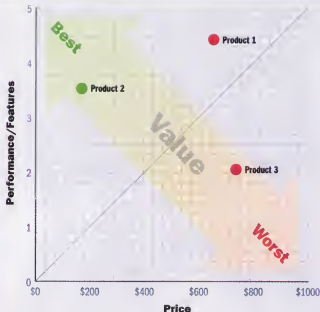

Although business projectors are generally used around the office and out on the road for presentations, we know that many of these make it home on the weekends for movie nights. While our tests focus on boardroom performance, we also spend some time measuring contrast levels and performance for movie playback.

In a similar vein, many small businesses are beginning to realise the benefits that can be garnered from running a server to help pool resources. Shared calendars and contacts, files and content management systems can help boost productivity, and it's now straightforward to install and configure a system. Developments at the enterprise end of the market have pushed small business servers down to less than \$3,000, including a copy of Microsoft Small Business Server 2003 or an enterprise-grade Linux distribution.

The final Labs Challenge this month looks at water-cooling kits. Apple has just launched a water-cooled G5, but hardcore geeks have been overclocking their systems and installing liquid-cooling for years. This technique is the ultimate way to get a quiet, stable and cool machine, but many are deterred because of the risk of leaks and damage to components. We've done the dirty work by setting up, testing and evaluating the leading products on the market to report on the designs that perform and those that just look the part.

apc price-to-performance ratio

The APC Price-to-Performance Ratio is a scatter graph, each point representing a reviewed product. The X-axis provides a price scale, and the Y-axis indicates features and performance as derived from the verdict awarded to each item. The diagonal line represents a line of expectation — as prices increase, a proportional increase in features or performance is also expected.

What do you think? Could we do it better?
Drop us a line at OnTest@apcmag.com with your comments or suggestions.

The key to business success.

What is it? How do you find it?

It kind of looks like this.

It's just one of NETGEAR's many solutions to business problems.

For your business to be successful, it pays to watch what other people are doing to achieve their goals. So, think about this:

More businesses connect with NETGEAR than with anyone else.

Why? Because NETGEAR delivers the technologies that are critical to business success. Technologies that are flexible, reliable and come with unparalleled technical support.

With a full range of business switching, routing and wireless technology, NETGEAR has the solutions to complex business networking problems. For when your business needs a more streamlined network. Or when you're facing rapid expansion. Or when you need to make fast changes to meet unexpected demands. And NETGEAR's products are ready to work out of the box. So it's easy to run things smoothly and efficiently.

With NETGEAR's ProSafe business solutions, you can have a better, faster business network.

So you can concentrate on the really important stuff.

Like your business.

AMD's big little processor

AMD is revising its product line by introducing a new entry-level processor. Is this the ideal lounge room CPU? *Matthew Overington and Nick Race report.*

On the road again

AMD has also released a number of Mobile Sempron processors to complement the desktop range. All processors are packaged in the Socket 754 lidless micro PGA form factor, though the range is pitched at a number of different platforms. The base model processors (Mobile AMD Sempron 2600+ and 2800+) have a thermal specification of 25W, which enables them to run in thin and light notebooks. The higher models (Mobile AMD Sempron 2600+, 2800+ and 3000+) have a thermal specification of 62W. These are likely to appear in larger budget notebooks aimed at students. Overseas, a number of manufacturers are offering machines built on Mobile Sempron processors. Expect local partners including Acer, Medion, Optima and Twinhead to follow suit.

On the move: Mobile Sempron processors complement the company's range of desktop chips.

AMD has made tremendous headway into Intel's market dominance in the past year and has driven 64-bit computing into the mainstream. The company is undoubtedly the leader in inexpensive 64-bit systems, but while AMD has done well out of its performance line of 64-bit processors, the entry-level end of the market sees more unit sales.

A cheaper alternative to AMD's flagship 64-bit units is essential for the company if it wants to remain a significant player in consumer IT. The Duron range has traditionally filled this space, though recent Athlon 64 releases have made the Duron appear dated. The 32-bit Athlon XP now fills the middle ground.

The PC industry is accustomed to seeing deadlines slip and major manufacturers miss shipping dates for both hardware and software releases. AMD bucked the trend by releasing the Sempron processor on 28 July, three weeks ahead of its scheduled 17 August launch date.

AMD is labelling the Sempron as its value processor and is pitching it at both consumers and businesses. It replaces the Duron line and is shaping up to offer real competition to Intel's Celeron brand. The Sempron is a great choice for DIY enthusiasts looking to build up inexpensive machines for use as media PCs, Internet gateways or production systems.

All Sempron processors are 32-bit, and focused on the lower end of the market where processing requirements aren't huge. With this release, AMD is seemingly saying that power users demand 64-bit processing capabilities, but that's overkill for most home or office tasks.

The Athlon XP will be phased out before the end of this year, leaving Sempron as AMD's x86-based processor and the Athlon 64 as the performance model. The most immediate and notable effect will be to reduce the possibility of confusion among consumers, as there are currently a number of different Athlons on the market.

New chip on the block: introducing AMD's entry-level Sempron processor.

LAUNCH NOTES

The processor launched at a number of different speeds on the Socket A architecture including 2200+, 2300+, 2400+, 2500+, 2600+, 2800+ and one on the Socket 754 form factor, numbered the 3100+. This system, while making it easier for most consumers to choose a platform, will result in some short-term headaches for box builders.

The Semprons up to and including 2800+ are designed to fit Socket A motherboards, while the 3100+ (and above, when released) run on the Socket 754 design like the early Athlon 64s. There is a plan to migrate the higher-clocking models across to Socket 939, but AMD is waiting until Socket 939 reaches wider acceptance in the market. All models are built on a 130nm process in AMD's Dresden fabrication plant.

All Socket A models feature a frontside bus speed of 333MHz and support for up to PC3200 DDR Memory (400MHz), while the 3100+ is built on Athlon 64 technology and features a 1,600MHz system bus and integrated memory controller.

BUILT-IN PROTECTION

The top processor is basically a 32-bit version of an Athlon 64 and includes a number of features previously only found on 64-bit processors. The NX (or No-Execute) flag is designed to help quell the spread of viruses and worms by preventing malicious code from execution at a hardware level. It requires SP2 to work correctly and doesn't allow worms like Blaster and Sasser to slip instructions into the pipeline and execute unwanted code. Security pundits hope this will help stem the onslaught of worms that has plagued the Windows platform.

Cool'n'Quiet is similar to Intel's SpeedStep technology and is designed to regulate CPU voltage and frequency to ensure that it runs at

optimum levels. The processor responds to increased workloads, meaning that the PC doesn't run hotter than it needs to, but power is there when required. More details can be found at www.apcmag.com/info/Cool_N_Quiet_guide.

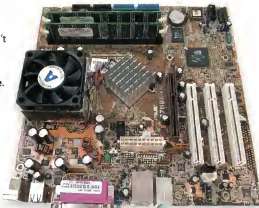

LOCAL AVAILABILITY

Although AMD is relying on resellers to set final local pricing, the Sempron 2800+ launched at US\$109 each for batches of 1,000. This puts the processor head-to-head with the Socket 478 Celerons in terms of price. AMD currently has the technological advantage by offering the Athlon 64's features on the Sempron 3100+, but this will be negated early next year.

Intel is planning to launch updated Celeron D processors in the first quarter of 2005 that are designed to run on the Socket 775 form factor. These new models will feature a J suffix and contain an "execute disable" bit (similar to AMD's NX flag) and Thermal Monitoring 2 (which controls the thermal output).

The lower-end Semprons, built on the ageing Socket A architecture and slow 333MHz frontside bus, have a limited life span but only generate 62W of heat, compared to Celeron's 73W. This makes it a good choice for any application that requires a quiet computer. Although few big name manufacturers currently build machines using AMD processors in Australia, Optima has announced a number of systems, including the WorkPro, built on a Sempron 3100+ processor.

APC benchmarked a Sempron 2800+ on an ASUS A7NBX-VM motherboard, featuring 512MB of Infineon PC3200 DDR RAM, onboard video, a Western Digital Caviar WD1200BB Parallel ATA drive and Windows XP Professional (running SP1). The unit achieved an impressive 19.4 under Business Winstone 2004 and a Multimedia

Diving platform: the Sempron provides an excellent launching point for high-performance, low-cost systems.

Content Creation Winstone 2004 score of 23.4. These benchmarks indicate that the processor is up to just about any word processing or media playback task, and could even run at a decent clip with half that amount of RAM.

Many systems built on these entry-level processors are destined for humble lives as media players or Internet boxes and will rely heavily on integrated components. AMD buyers are better off as they have the choice of motherboards running on inexpensive chipsets from VIA, SIS and Nvidia.

At the entry level, most AMD motherboards come with Nvidia onboard graphics, which provide superior video performance over the 865G Extreme solution favoured by most Intel buyers. Both are inadequate for running modern games, but the Nvidia solution offers superior video playback. In an area where value for money is important, this could be enough to see the Sempron become the platform of choice for lounge room computing. **EDITED**

Codename: Roadmap

A Sempron processor is actually one of two cores. All but the 3100+ Sempron are currently based on the Socket A technology of the Athlon XP family. The 3100+ and newer, unannounced Semprons (codenamed Palermo) are based on the Athlon 64 core. As speeds in the Athlon 64 range increase, slower chips will drop down into the Sempron range in a 32-bit incarnation, until Socket A technology is phased out. There's no timeline on this process, though AMD's manager for Australia and New Zealand, John Robinson, has indicated that Athlon XP processors will be gone by the end of 2004.

With the workstation Athlon 64 processor now running on Socket 939, developments are steady. Current and upcoming chips are based on the Winchester core, built on a 90nm SOI fabrication process. No replacements have been announced until at least the end of 2005.

AMD's Athlon FX series chips are indicated on AMD's roadmap, and a few changes are in the pipeline. There will be a switch to the 90nm SOI fabrication process (codenamed San Diego) early next year. A dual core model (codenamed Toledo) is slated for the second half of 2005.

Processor details

BatteryMark (hr:min)

0 **1:39** 6:00

Top specs mean impressive benchmarks but poor battery life.

Dell positions its Inspiron range of notebooks towards business users, and the sleek 700m looks good enough to mix it with the latest stylish releases from Sony and ASUS.

At 1.9kg, the new Inspiron is light enough to carry around all day but has enough power to drive serious applications. The entire underside of the chassis is metal, designed to provide a strong platform while dissipating heat. It also serves to eliminate the lateral flex common to many ultra-portable units.

The unit features a wide-screen display running in a native resolution of 1,280 x 800 pixels, with an aspect ratio of 16:10. And while the screen only measures 12.1in diagonally, it manages to squeeze in plenty of information. This screen shape makes sense for mobile users as it closely mirrors the shape of the

keyboard and enables the 700m's chassis to be shallow while still including a full suite of notebook hardware.

The 700m, which has been built on the i855 chipset, is a screamer on paper, boasting a 1.8GHz Pentium M processor, 1GB of RAM and an 80GB 5,400rpm hard disk. These are impressive specs for any notebook, let alone an ultra-portable.

The rest of the machine's specs are similarly impressive, boasting SD and PC Card readers, VGA and S-Video outputs, two USB 2.0 ports and a FireWire connector. A 56K modem, 10/100 Ethernet and 802.11g Wi-Fi round out the connectivity options. Dell advises that no Bluetooth module for this system is available.

The screen has a special high-gloss coating, as seen on a number of Toshiba and Sony units through APC Labs in recent months. This substantially boosts the clarity of a standard TFT screen, though at the expense of some additional glare. However, the glare is offset by the screen's brightness, which makes it fantastic for watching DVDs and working in brightly-lit environments.

POWER TO BURN

The Inspiron 700m effortlessly cruises to a score of 21.2 under Business Winstone 2004,

backing that up with a result of 24.7 under Multimedia Content Creation Winstone 2004. The onboard graphics controller isn't able to muster a strong showing under 3D benchmarking, but this machine wasn't designed for gaming.

While far from perfect, the one hour and 39 minutes of battery life should be adequate for most users. The machine ships with a four-cell battery, but Dell also offers an eight-cell unit for \$169 which should push battery life out to around five hours. Extra four-cell batteries are \$127 each, but the eight-cell unit is the better buy if you're shopping for a spare.

OFF KEY

Unfortunately, in a class where many sacrifices have to be made to fit all the components into a tiny space, Dell has skimped on the keyboard. While thin and light notebooks are renowned for poor keyboards, the Inspiron 700m suffers more than most.

The keys, though generally well laid-out, suffer a couple of minor issues. They have some slight lateral movement and are quite clacky to type on. This makes it difficult to type quietly — an issue that can drive a user's fellow workers to distraction.

The keyboard also features shrunken comma, full stop and question mark keys between the M and right Shift that may pose difficulties for touch typists. However, keyboard comfort is subjective, which is why you should always try out a notebook before committing to a purchase.

Another negative point against the Inspiron is the fact that it ships with Windows XP Home, which doesn't really cut the mustard in a corporate environment. However, Windows XP Professional is available for an additional \$109. It provides the notebook with the ability to connect to a domain and offers power user goodies such as FireWire networking.

Although software generally incurs an extra cost, Dell has bundled some software with the system, including Dell Media Experience, CyberLink Power2Go and a 90-day trial version of Norton Internet Security 2004. Discounts on the full versions of Norton Internet Security and Microsoft Office Basic are also offered.

All up, Dell has done a great job with the Inspiron 700m. It's light and powerful, and when fitted with a copy of Windows XP Professional and an eight-cell battery, would be a top-notch machine for any frequent traveller with deep pockets.

Matthew Overington

Replace Colours Individually.

In the EPSON range of printers and multi functional printers, you only need to change the individual colour when required. Which means a lot less wastage. What's more our Intellidge Ink System indicates exactly when you need to make changes as each colour runs out. For further information, call 1300 361 054 or www.epson.com.au

PCMark04

3DMark2003

Multimedia Content Creation Winstone

Business Content Winstone

The 915 chipset proves a top performer across all tests.

The Alderwood and Grantsdale chipsets were always set to turn the PC market upside down. Now third parties have had time to perfect their i915 and i925 offerings, new products are being released to satisfy the early adopters and performance buffs. Shuttle's SB81P barebones kit takes advantage of the new i915 chipset.

Historically, small form factor (SFF) boxes have been a trade-off between the convenience of the diminutive unit and upgradeability. The SB81P neatly fits in three 3.5in hard disk drives, a 6-in-1 card reader and a 5.25in optical drive into the case.

ON THE INSIDE

The small box packs a punch: the motherboard features a Socket 775 Pentium 4 CPU slot, four Serial ATA connectors supported by an Intel ICH-6R RAID controller, a single Parallel ATA connector for optical drives, a PCI slot and a single PCI Express x16 slot for a video card.

Up to 2GB of dual-channel DDR memory is also supported. DDR RAM has been chosen over DDR2 because it's cheaper and, for the moment at least, faster. Testing with DDR2 RAM shows current performance to be on par or even slightly lower than DDR on the 915 chipset due to higher latency timings, and it may be some time before the real benefits of DDR2 become apparent.

Shuttle has fitted a quiet and powerful 350W power supply into the SB81P. This supplies more than enough grunt to power hard disks and peripheral devices, and is even up to driving power-hungry video cards.

The airflow for the CPU runs across the width of the case. Cool air is drawn from the side of the

box and channelled across a heat pipe-driven heatsink. As cooler air is used, the fans can be driven more slowly, reducing noise.

Building the system up is a simple affair. Shuttle claims tool-less servicing on the SB81P, though a screwdriver is required to remove and replace the CPU heatsink. All drives attach with tensioned drive rails, which don't require

screws. Two plastic tabs keep the drive cage containing the primary hard disk drive, optical drive and the card reader firmly affixed.

Two additional 3.5in hard disks can be installed if required. Two small fans at the top rear of the case blow air over the mounted hard disk drives, keeping them cool in the tight space.

UP TO SCRATCH

Out of the box, the SB81P uses the Intel Graphics Media Accelerator (GMA) 900 to provide 2D and 3D functionality. Though underpowered for current high-end video games, the GMA 900 is more than adequate for day-to-day use, as proven by a score of 1,422 under 3DMark2003.

Fitting a more capable graphics adaptor is a breeze thanks to the inclusion of a PCI Express x16 slot. The case is designed to accommodate the larger cards on the market today, though judicious use of internal power extensions may be required for the more power-hungry video cards. An Nvidia GeForce 6800 GT was fitted for 3D testing, but the shroud for the CPU cover needed to be removed to fit the card.

The front of the case sports one FireWire 400 and two USB 2.0 ports, a microphone in and headphone audio connectors. There's also a pre-installed 6-in-1 card reader with support for Memory Stick, Secure Digital, Compact Flash, MultiMedia Card, Smart Media and MicroDrive.

Bundled with InterVideo Home Theater software, the SB81P has more than enough power to act as a media server, though you'll need to buy a separate remote control. Supporting 7.1 audio, optical S/PDIF in and out, coaxial S/PDIF in, headphone output and an analog line in, connections to any speaker system or home entertainment equipment is easy.

The 915 chipset performs well across all tests. A score of 4,693 is achieved in PCMark04 using onboard graphics. A Business Winstone of 23.6 is within the expected range for the 915 chipset and a Multimedia Content Creation 2004 Winstone of 32.3 is close to that of the Intel reference board when tested with 1GB of RAM and PCIe video card.

When tested with a high-performance Nvidia 6800 GT PCI Express video card, the Shuttle manages a PCMark04 score of 5,337 and 10,755 under 3DMark2003. These are some of the highest scores ever seen in the APC labs.

The Shuttle SB81P constitutes a solid base from which to build a powerful system. With a variety of connectivity options and plenty of room for both a top-end video card and a number of hard disk drives, the SB81P is a winner.

WARNING

Shuttle XP17 LCD monitor

A new form design makes transportation easy, but a slow refresh rate may scare away gamers.

Taiwan's Shuttle Corporation initially became well known for its range of small form factor PC enclosures. The company has since sought to flesh out its range of barebones kits with the introduction of a number of accessories such as remote controls and Bluetooth and Wi-Fi modules. With the release of the XP17 17in LCD monitor, Shuttle has taken the next step toward providing a complete branded solution.

Embedded in a flat sheet of tempered glass surrounded by a tube aluminium frame, the screen gives the impression that it should be able to take quite a battering.

Standing on a swing-out back support in an easel-like configuration, the monitor is quite stable thanks to its width and non-slip pads on the frame. The unit can be adjusted by moving the back support in and out, but because of its tripod arrangement the screen will always be tilted up from the desk. The back mount can also swivel 90° for use in portrait mode.

An external 12V AC adaptor means that when folded, the screen measures a svelte 8cm deep. An

integrated handle makes transportation a cinch and the supplied carry bag offers excellent protection when moving the screen. The bag has sufficient room to carry cables, a keyboard and mouse as well as the monitor.

The Shuttle XP17 supports a native resolution of 1,280 x 1,024 pixels, though gaming at this resolution requires a very beefy video card. The 16.2 million colour range will be suitable for everyone except graphic designers relying on the colour accuracy of the display.

In testing, the screen makes short work of the DisplayMate benchmark for clarity and brightness. Nokia's Monitor Test application shows clear delineation of brightness from 1%. These gruelling applications run the screen through a wide range of colour, brightness, saturation and moiré tests.

The monitor itself is great: it's distinctive, clear and bright. The only problem is the refresh rate: a 16ms pixel response time is almost unforgivable in an LCD monitor aimed at the performance market. Though Shuttle's design is first-class, this one flaw makes the screen less appealing to the fast action game aficionado.

Verdict	★★★★☆

Lexmark X4270 All-In-One Office Centre

Lexmark's small-biz multifunction centre is a solid choice for businesses with light demands.

Multifunction centres (MFCs) are being held responsible for a slump in dedicated flatbed scanner sales as businesses look to save space and money. Although many of the X4270's fax, telephone, colour printer, scanner and copier functions would be useful in a home environment, the machine is ideally suited to small businesses looking to consolidate several pieces of hardware into a single device.

The handset includes a 79-number speed dial function and features a 33.6Kbit/s fax/modem. Many devices in this price range rely on Windows to handle copying and faxing, meaning that they don't work under Linux. The X4270 is an exception, and includes internal memory for handling 160 pages. It supports fax forwarding and also works flawlessly with answering machines. The group fax function enables you to send a single fax to multiple recipients.

Print resolution is an excellent 4,800 x 1,200dpi for colour and 2,400 x 1,200dpi for monochrome. It performs acceptably under benchmarking,

managing nine pages per minute in draft settings and four in high-quality mode. Printed sheets show minimal signs of banding or smudging and the draft mode produces pages of sufficient quality for use in office environments.

The print head is included with the cartridge, so you effectively get an entirely new print system when you replace cartridges. Regular black and colour cartridges rated to 600 pages at 5% coverage are available for \$53.99 and \$64.99 respectively. Heavy users should opt for Lexmark's high-yield units, rated to 1,100 pages at 5% coverage for \$65.99 (black) and \$86.99 (colour).

The scanner runs at an optical resolution of 600 x 1,200dpi and produces reasonable results. It's ample for office copying and printing, but shows signs of banding on monochrome scans.

Lexmark's control software is easy to install and use, and a single reboot enables the user to access common functions from a unified interface.

One of the X4270's most impressive features is Lexmark's one-year warranty, whereby the company handles the collection and return as well as repair or replacement of any faulty machine.

Security guard: WatchGuard's Firebox is the ultimate firewall for SMEs.

Enterprise ready

Although the WatchGuard Firebox is designed to grow with your business, dedicated small business or enterprise customers may want to look at some other solutions before committing to a purchase. Symantec offers a range of hardware firewall products, starting with the Symantec Gateway Security 300 Series unit designed for small businesses. The base model retails for \$799. More information, including local contact details, can be found online at www.symantec.com.au.

Price	X500, \$3,150; X700, \$3,750; X1000, \$4,950; X2500, \$7,850
Intended market	Enterprise/business
✓	Upgradeable: solid business firewall.
✗	No Web management.
Verdict	★★★★★

Choosing an appropriate firewall for a small to medium business can be a tricky task. While many high-end hardware appliances exist, buyers are generally locked into a specific hardware product due to a lack of expandability. However, there's

little point in investing in a hardware solution if it isn't going to grow with your company, and placing a bottleneck on an incoming Internet or wide area network (WAN) connection is a recipe for lost productivity.

WatchGuard has been a player in the local enterprise firewall space since 1997 and has recently launched a one-size-fits-all hardware firewall in several configurations. The unit includes six Ethernet ports — three are enabled by default, the other three can be turned on for an additional charge. This ability to segment the network at the firewall is a handy feature for IT administrators, though some will still rely on their existing topology. A serial port is present for those looking for console control.

LINUX STABILITY

Inside the box is a regular mini PC running on a 1.26GHz processor and 256MB of RAM with 64MB of flash memory. Linux drives the system, meaning that it's not only exceptionally stable, but also upgradable. The company sells the same physical hardware at several different price points, depending on the software options.

By default, the Firebox X500 supports 250 authenticated users and offers a firewall throughput of 100Mbit/s. This can be upgraded to the X700, which offers a throughput of 150Mbit/s, and then the X1000, which offers support for 1,000 authenticated users and a throughput of 225Mbit/s. The final step is up to the X2500, which offers a throughput of 250Mbit/s, 5,000 authenticated users, and a maximum of 500,000 concurrent sessions.

The chassis of the machine is designed to slip into a single rack slot, and configuration is straightforward. The user must first set up the IP addresses of the unit, and then configure the box itself using the bundled WatchGuard System Manager. There's no Web management interface as yet, but it's in the pipeline.

An LCD panel provides feedback, detailing CPU and memory usage and which ports are in use. This is a great feature as the administrator doesn't have to run monitoring tools.

STARTING SMALL

Although the list of features is comprehensive, the X500 base model is pitched at businesses and enterprise customers that haven't previously used a hardware firewall. All models in the range offer the same basic features, and administrators can pay for additional network user support.

The range employs WatchGuard's intelligent layer switching (ILS) technology to step through the features, all of which are turned off by default. This allows the administrator to enable features if and when they're needed. Each Firebox model includes authentication, a firewall, VPN services, application-layer inspection, a rules-based email filter that can be used to control spam, and a content filter for controlling access to Web sites.

One excellent feature is a protocol-anomaly detector that looks at packets sent through the device for anything that doesn't adhere exactly to protocols. This forms a safety net for any malicious data that has slipped through the other traps.

SpamScreen, the email blocker, relies on rules to screen out spam and does a reasonable job. Although it's not as flexible as a desktop-based software solution, it does prevent a good deal of spam from hitting your internal network. Spam can be blocked directly or marked with a tag so it can be filtered by desktop email apps. This is a great feature as it prevents emails from being lost due to an over-zealous firewall application.

The content filter, WebBlocker, is easy to configure and is effective at preventing access to sites that employers would rather ban from the workplace. It's also possible to block access during certain times of the day or on a per-user basis.

SECURE VPN

An increasing number of professionals are working from home, and many corporations are demanding that users telecommunicate via VPN connections. VPN has become de rigueur in the last few years, and pass through is now supported by most ADSL modems on the market. Both IPSec and PPTP are supported, though IPSec support requires an additional licence.

WatchGuard quotes an 80% success rate at blocking viruses, and during our tests we attempted to send infected files through the firewall. On each attempt, the box successfully stripped out the virus.

Matthew Overington

Business

Want your business to be more efficient? Put on a 24hr a day manager.

Making your business run more efficiently can often mean finding better ways to bring your people together. By employing the right server solution for your size business, your staff can easily share documents, internet, databases, software applications, printers and communicate via email.

Together with our business partners, HP is helping more Australian businesses achieve their ideal network environment. How? By providing simple, affordable server solutions that make your business processes more efficient. A HP reseller can help you choose the right server solution which may include Microsoft® Windows® Small Business Server 2003. And all HP ProLiant servers, come with industry – leading reliability, giving you complete peace of mind.

Trust Australia's leading server to bring your people together making your business the most efficient around town – the HP ProLiant server, powered by Intel® Processors.

HP PROLIANT ML110

A great entry level, single processor server, ideal for small business or home office.

Picasa 1.618

The latest addition to the Google family is a godsend for anyone having trouble managing digital images. And it's free.

Details

Contact	Picasa
Online	www.picasa.com/google
Price	Free
Intended market	Everyone
✓	Fast; stable; easy to use.
✗	Doesn't adhere to Windows UI models.
Verdict	★★★★★

Keeping track of digital images and videos can be a monumental task. While applications like PaintShop Photo Album 5 offer a range of features for power users, there's now significant competition from free apps.

Picasa delivers unrivalled control over images and is one of the best image

viewers available today. The app trawls your hard disk for photos, and then catalogues them by date taken. The screen is split into two panes: the left contains album names as derived by folder names and file information, and the right displays thumbnails of all the images in each album.

The screen layout is intuitive and easy to use — it looks and feels much like Apple's iPhoto. Images can be dragged into a "Picture Tray", where they can then be edited or have batch functions performed on them. A modest collection of touch-up tools is bundled, including

red-eye reduction, cropping and image enhancement. Power users can resize images for the Web via the export function.

Although these manipulation options are relatively basic, they're ample for most users, especially given that the application is free. Anyone seeking more advanced functionality can shell out for a dedicated image editing tool.

Users can also send "Hellos" at <http://hello.com>, where images are made available for friends and family to view and comment on. This feature is a time saver for those who don't want to cut HTML code and upload images via FTP.

Picasa's outstanding feature is its search functionality, especially speed. The search is narrowed down as each character is typed, and is complete by the time you've finished typing.

Some of the features found here, like red-eye reduction and rotating, will ship as standard with Windows Longhorn, but Picasa gives access to these functions in the meantime. And while it's geared towards new computer users, there's plenty here for the power user, too. As a free piece of software with outstanding features, expect to see Picasa become very popular very quickly.

Matthew Overington

Highpoint RocketRAID 1820

Highpoint makes adding RAID 5 support to a business machine affordable and easy.

Details

Contact	Altech Computers
Phone	(02) 9735 5655
Online	www.altech.com.au
Price	\$330
Intended market	Enterprise; performance enthusiasts
✓	Price; failsafe and email notification features.
✗	No Mac support.
Verdict	★★★★★

While onboard RAID solutions are usually sufficient for home users, higher RAID levels require three or more drives, which puts such solutions beyond the reach of many domestic consumers. However, businesses require RAID 5 in order to give servers and high-end workstations the best balance between fault tolerance and performance. Highpoint's RocketRAID 1820 features eight SATA ports and can simultaneously support a number of arrays.

Several failsafe features make the RocketRAID 1820 ideal for critical apps. Assigning drives to a reserve pool allows the controller to rebuild any non-RAID 0 array upon drive failure. While the array is being rebuilt, data on the broken array is still accessible, albeit at a slower rate.

Management software for both Windows and Linux is included which allows you to create, remove and modify arrays. This software can also be installed on another PC, allowing for remote administration and management. A user management system assigns different levels of access controls to different users, and can also

notify network administrators of notable events, including disk failure, by email.

Solid performance is a hallmark of the card. Even when used in a PCI slot, RAID 0 performance is comparable to onboard solutions — both the RocketRAID and Intel's ICH5 SATA RAID controllers produce a burst read rate approaching 100MB/s, with an average read rate of just over 40MB/s. One area where the RocketRAID jumps slightly ahead is CPU resource usage — it uses only 3.8% of resources from the test Pentium 4 3GHz CPU instead of the 7.1% consumed by Intel's chipset.

In RAID 5 solutions, the burst read rate in a three-drive configuration goes up to 118.6MB/s — a figure limited by the maximum speed of the PCI bus. The CPU is not penalised with such a configuration either — usage remains a low 3%.

A half-height back plate is included, allowing the card to be installed in 2RU servers or compact workstations, along with eight 50cm SATA cables. About the only thing missing is Mac support.

If you need RAID 5 and you've got a workstation with a PCI-X slot, this is a top buy. Even if you're limited to using the PCI bus, there are still performance benefits to be found.

Adobe Video Collection 2.5 Pro

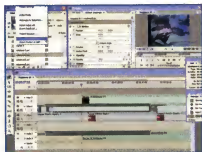

Adobe's long line of quality movie-making applications is now

available in one big box.

Precise control: After Effects' accurate colour control and RAM preview mean less time watching the hourglass spin and more time being creative.

Room to move: Premiere Pro 1.5 now works seamlessly with other professional video editing applications through EDL.

Audio utility: Audition 1.5 provides many audio tools not available in Premiere Pro.

Details

Contact	Adobe
Phone	1300 550 305
Online	www.adobe.com.au
Price	\$2,999
Intended market	Business
✓	Improved Encore; HD and EDL support in Premiere Pro 1.5.
✗	Requires training — there are no wizards to help beginners.
Verdict	★★★★☆

Adobe has taken a pointer from Microsoft's successful Office strategy by offering all its video creation tools in one compelling package. Adobe Video Collection 2.5 Professional includes Premiere Pro 1.5, After Effects 6.5 Professional, Audition 1.5, Photoshop CS and Encore DVD 1.5. All the bundled applications are new releases, apart from Photoshop CS which has been available for several months. And each application has its own registration number, which should suit small studios with several workstations.

The Video Collection Standard version (\$1,999) includes After Effects 6.5 Standard but omits Photoshop CS.

STUDIO IN A BOX

Adobe Premiere may have seemed like a professional video editing tool to many enthusiasts, but the lack of compatibility with high-end editing applications has kept it out of the top production studios.

However, new features such as Edit Decision List (EDL) support will undoubtedly make Premiere Pro 1.5 more appealing to professionals. It provides the ability to export and import edit information from timelines to apps from Avid, Discreet and Apple.

High Definition (HD) video support provides the tools to create 16:9 format video via HD camcorders.

Nested timelines allow you to perform a series of actions on a range of clips, a shortcut that can save serious editing time when working on large

projects. Another workflow improvement stems from the inclusion of modifier keys that enable you to set Ctrl and Alt key combinations.

On the audio side, Premiere Pro allows you to zoom in on an audio section, making it easy to quickly isolate and remove anomalies such as crackles or hiss. The capacity to input live voice recording directly into a timeline is handy for documentary or interview videos.

ANOTHER ENCORE

Adobe has introduced some elements designed to enhance stability in Encore DVD 1.5, along with

several new features to improve workflow with other Adobe applications.

Control over the user experience is essential if you want to create commercially distributed titles, and Encore DVD 1.5 allows you to disable or enable a viewer's remote control operations in specific sections of a DVD. For instance, you can force viewers to watch copyright notices for a certain length of time.

Chapter points from markers in AVI files created in Premiere Pro and After Effects can be integrated straight into the Encore timeline. This saves a lot of time as you can quickly determine how a DVD title will unfold while making cuts. Strong support for Photoshop CS also means layout and alignment decisions will be replicated exactly within an Encore menu panel.

Custom workspaces should also please DVD creators, allowing specific tasks to be saved for future projects, as well as preset window arrangements for repeat clients or repetitive jobs.

Encore DVD 1.5 doesn't really blow away competitors such as Ulead DVD Workshop 2 in terms of features, but will help streamline the workflow if used in conjunction with Premiere Pro and Photoshop CS.

GOING TO THE MOVIES

After Effects Professional 6.5 is the only Adobe product in the Video Collection that is used by major production studios around the world. It's also the only video-based Adobe app available for the Mac platform (Premiere, Encore DVD and Audition are only available for Windows XP).

A couple of noteworthy new features in this version include a cloning tool which replicates an area of a video (in much the same way as the stamp tool in Photoshop) and tighter integration with Encore, Premiere Pro and Photoshop CS.

Adobe recently purchased Cool Edit Pro audio editing software from Syntrillium and rebadged it as Audition 1.0, with virtually no input from the Adobe development team. Adobe-Inspired features for Audition 1.5 include stronger support for Premiere project timelines and the ability to isolate particular frequencies to help remove extraneous noise, as well as support for the popular VST plug-in format. Sadly, the user interface lacks Adobe's typical look and feel.

At around \$3,000, many video editors will find the Video Collection Professional package too good to resist. But if you're an existing Premiere Pro user and don't want to export your edit lists to other applications or work in HD video, wait until the next major release.

IMSI TurboCAD Professional 10

TurboCAD isn't just for engineers and architects, but you have to be prepared to learn the ropes.

Picture perfect: TurboCAD Professional 10 renders objects well, but lighting adjustments may be needed for best results.

Today's large displays and powerful CPUs put CAD within the reach of ordinary users planning home renovations, preparing drawings for engineers, or creating 3D images to incorporate into a presentation.

TurboCAD Professional 10 promises easy creation of 3D objects, photorealistic visualisation and improved architectural

tools. Although it's aimed at serious CAD users, APC examined the program from the perspective of a power user, not a draughting professional.

The software is also available in Academic and Deluxe editions. The Academic edition is comprised of the full Professional package licensed for non-commercial use, plus a 2D CAD fundamentals course on CD-ROM certified by TAFE NSW. Users can enrol as distance students with TAFE NSW to gain certification.

TurboCAD Deluxe 10 is a simpler and cheaper alternative which includes a 10-day trial of the CAD course. The program itself lacks some of the Professional version's more sophisticated 3D features, including materials settings, support for multiple monitors, roofs (for architectural drawings), macro recorder and VBA support.

IN THE BOX

The Professional interface bristles with toolbars, tabs and other elements. Traditional engineering drawings of relatively simple objects — including plan, side and front elevations, and even isometric views — are easy to construct once you've found your way around the toolbars and menus. "Brief overviews" of the user interface and basic editing functions are enough to get you started, but the absence of any substantial tutorials handicaps the newcomer. The manual is comprehensive and well organised, but doesn't provide a tutorial.

The TurboCAD 2D and 3D Training Guides are essential for the new TurboCAD user and cost \$130 for the pair (\$75 individually). Even if your interest is 3D modelling, work through the 2D training to learn your way around the toolbars.

MODELLING

Primitive objects such as blocks and spheres can be added to or subtracted from each other to create more complex shapes. For architectural designs, floorplans can be laid out and then the walls given height (with different materials applied to either side). Alternatively, create the floorplan in the accompanying FloorPlan 3D app, then complete the job in TurboCAD.

A substantial library of symbols — covering furniture, electronic components, IT equipment and more — is provided on a second CD to save drawing everything from scratch. Objects within a model can be given custom properties (such as supplier or price), and can generate reports on quantities of certain hardware components required or bills of materials generated.

Three-dimensional models can be displayed in one of four ways: wireframe, hidden line removal, draft rendering and quality rendering. Each style comes with numerous options and the default settings are well chosen.

The appearance of an object also depends on the materials applied to its surfaces and the lighting selected. Backgrounds can be added to quality-rendered models. It's possible to create and edit items in a rendered view, but this requires a particularly fast computer — it's quicker and easier to work in wireframe or hidden line modes.

OUTPUT

Converting a 3D model into a conventional orthographic (front, side and plan) drawing is achieved by creating views of the model from the required sides, switching to "paper space", and creating a viewport corresponding to each view. The viewpoints can be arranged as desired and details such as labels and dimension lines added.

In addition to printed output, TurboCAD exports to a variety of file types including JPEG and EPS, plus specialised formats such as IGES, DWG and DXF.

The Publish to HTML feature outputs a JPEG file plus simple HTML code to display it, but when the current view is published rather than the entire model, the bounds don't match those displayed by TurboCAD and sometimes cause unattractive clipping at the edge of the model.

Producing accurate orthographic or isometric drawings is easy in TurboCAD, but the Professional edition is overkill if that's all you need. The Pro version comes into its own for complex 3D modelling with high-quality rendering and easy conversion into 2D drawings, but the more casual user can get by with the Deluxe version.

Stephen Withers

AutoCAD

<http://south-apac.autodesk.com>

Probably the best-known CAD package, AutoCAD is also available in versions for electrical and mechanical design. Training is widely available at TAFE colleges and other institutions.

CADView/7

<http://fastcad.com/n-view7d.html>

Perhaps you don't create drawings, but you do need to display or print other people's work. CADView/7 does that job for DXF and DWG files.

mediaRECOVER recovery software

Like a recycle bin for your memory cards, mediaRECOVER is an invaluable tool for reviving deleted, corrupted or formatted image files.

A momentary lapse of concentration is all it takes to send a valuable file to an untimely end. Fortunately, the Windows Recycle Bin offers a level of protection from erasing files by accident. However, it's helpless when it comes to removable media.

MediaRECOVER is

specifically designed to "undelete" image files you may have binned by mistake, and can also recover formatted and corrupted files. While it can restore data deleted from the hard disk, mediaRECOVER is best used for removable media, including memory cards, USB keys, PC Cards and Zip and floppy disks. Recoverable image types include JPEG, EXIF, TIFF, PNG, GIF, BMP and RAW images, as well as AVI, MOV and MPEG files, but not MP3.

The software has a simple interface and a wizard to guide you through the steps of using the Recovery tool. You can choose a deep scan,

which examines disk clusters for formatted or corrupted images, or a quick scan, which pulls up deleted files. The Format tool is used to condition a disk or memory card for recovery if it comes up as corrupt, unable to initialise or otherwise not mountable. You can also use mediaRECOVER to permanently wipe a disk.

In testing, mediaRECOVER has little trouble retrieving lost files saved on a USB key, as well as a SD memory card. Even a full format doesn't stop it finding the images again. A memory card was removed during the transfer of a large image, but mediaRECOVER was able to remount the drive and find a truncated version of the file.

The main criticism of mediaRECOVER is that it will only identify memory cards that are mountable. MediaRECOVER simply can't see cameras, PDAs, Smartphones and other memory card-equipped devices that don't appear as removable disks to Windows.

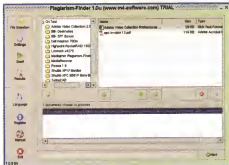

Despite this shortcoming, \$49.95 is a small price to pay if mediaRECOVER retrieves a photo that means a lot to you. It's also available for Mac OS X, but check to ensure that your memory cards are mountable before you buy.

Mediaphor Plagiarism-Finder 1.0.9

Finally, teachers gain an ally in the ongoing war on plagiarism.

For years, teachers have been fighting plagiarism, but with the advent of the Internet, the battle seemed lost forever.

German software house Mediaphor is turning the tables on would-be cheats with Plagiarism-Finder, a program designed to scour online articles for designated quotes and snippets. The application runs on every version of Windows from 98

through to 2003 Server and is invaluable for anyone marking students' work, as well as anyone looking to ensure that none of their work has been reproduced illegally online.

Plagiarism-Finder has the ability to search through a wide range of file formats, including Microsoft Word (DOC), Rich Text Format (RTF), Adobe Acrobat (PDF) and HTML and programming code through spreadsheets, PowerPoint and programming code would really round out the package's usefulness.

Users can choose to search on a number of criteria ranging from a random sampling of text,

through to a complete examination. A customised level is also available for users wanting to tailor their search requests.

APC tested the software by taking some quotes from articles published at a number of news sites, as well as www.apcmag.com. The software correctly identified the origin of each sample excerpt and in some instances a number of matches were confirmed. Mostly this occurred when content had been syndicated across a number of publications, though it could also be useful in identifying often-copied passages.

Sample tests took between 60 seconds and 35 minutes, depending on the speed of the Internet connection and the complexity of the request. The quick searches lack detailed information.

For anyone earning a living as a writer or editor, Plagiarism-Finder will pay for itself in no time. A 30-day trial is available for potential users looking to give the software a test run before committing to the US\$125 purchase price.

There's no doubt that the Internet has been a boon to anyone seeking to pass off the work of others as their own. This application enables the good guys to fight back.

NetComm Mobile VPN Firewall

Simple, straightforward office connectivity for when you're on the road.

NetComm's Mobile VPN Firewall is a USB network dongle aimed at corporate travellers who need to establish VPN connections quickly and securely from a range of potentially hostile networks.

Installation is as simple as connecting the USB cable to your PC and plugging a Cat5 lead into the adaptor. Windows quickly detects the device and then asks for the driver CD. Considering the driver files are less than 32KB, they really should have been included on the flash memory.

Once installed, a valid private IP address is automatically assigned. Further configuration is performed through a rudimentary Web interface.

A variety of different WAN connections are supported, including PPPoE, DHCP, static IP and Cable Heartbeat. However, the Mobile VPN Firewall's MAC address can't be changed and PPPoA connections aren't supported.

Up to five different IPSec tunnels can be configured and connected simultaneously. Each tunnel can support both DES and 3DES encryption and use MD5 or SHA authentication hashes of 768-bit or 1,024-bit key lengths. Key management

can be specified manually or automatically dealt with through the Internet Key Exchange (IKE).

Ultimately, the restricting features of the device hamper its usability. You can't employ it to establish CIPE, Open VPN or native PPTP VPNs. No ports can be specified to accept incoming connections on, nor does the firewall support UPnP — making it impossible to accept inbound connections, even if you wanted to. A maximum of 10 URLs can be blocked by the firewall and only Windows operating systems are supported.

Generally, IPSec tunnels can't be established through NAT gateways. This is because IPSec performs integrity checks over the entire packet at the endpoints, detects that NAT has modified the TCP/UDP headers and discards the packet. With the limited tests able to be run in the APC Labs, a secure tunnel was set up with no additional configuration. A NetComm product engineer advised that no NAT gateway should prevent VPN connections from being made.

If you want the convenience of plug-and-play VPN access, NetComm's Mobile VPN Firewall is a handy device. Just don't expect too much in the way of flexibility.

Verdict	★★★★☆

Pioneer DVR-A08XLR Double Layer DVD writer

The DVD writer speed race is on, and Pioneer has set the pace with a new 16x sprinter.

With the A08XLR, Pioneer has upped the DVD burning ante, adding support for 16x burning with both DVD+R and DVD-R. However, the best feature of this drive is its Double Layer (DL) speed. The ability to burn a DL DVD+R disc at 4x reduces the waiting time from over 45 minutes to just 27.

Supporting DVD±R writing at 16x, DVD±RW writing at 4x, as well as CD-R and CD-RW at 32x and 24x respectively, the A08 is a screamer. The A08XLR writes an 8x Maxell DVD-R disc in six minutes and 44 seconds at an average speed of 10.13x. The slow average is due to the use of Z-CLV (Constant Linear Velocity) technology, which periodically increases the burn speed up to the maximum supported.

Testing shows the unit only writes the disc at 16x for less than five seconds at the end of a 4.7GB test burn. This is slower than drives burning at 12x in CAV (Constant Angular Velocity) mode.

CD burn tests clock the drive at 24.92x, taking three minutes and 47 seconds to fill a 700MB test

disc. This result is on par with other writers on the market, but the drive really leaps ahead in DVD+R DL writing. Though a jump from 2.4x to 4x doesn't sound like a great deal on paper, it saves over 10 minutes per disc in practice.

A full 8.5GB DVD+R DL (Verbatim 2.4x rated) disc is written in 27 minutes and two seconds at an average speed of 3.99x — an excellent result. Although the media doesn't specifically support writing at 4x, testing indicates that a number of the 2.4x-rated discs are capable of sustaining writing at 4x.

The Pioneer DVR-A08XLR is packaged with Nero Suite OEM version 3, which includes Nero Express, InCD and NeroVision, plus Ulead's DVD MovieFactory 3.5SE. Pioneer also bundles an 8x DVD-R and a 4x DVD-RW to get you started.

Clearly, the Pioneer DVR-A08XLR is a very good piece of hardware. If DL burning is what you're after, you can't go past the A08XLR for ultra-quick performance. However, if your primary requirement is to write single layer media as fast as possible, consider a high-end 12x drive that burns in CAV such as the Plectro PX-712A (see "Extreme DVD", page 93).

Desktop replacement notebooks

Matthew Overington examines three notebooks that shine when performance matters more than portability.

The majority of notebooks available are marketed towards business buyers, but the reality is that portables have become extremely popular as consumer devices.

Most people use notebooks for work, playing DVDs, and even a little gaming. But while thin and light machines are ideal for busy executives, they're inadequate for most multimedia apps.

These desktop replacement notebooks are suited to buyers who want the ultimate in power and don't mind lugging around a little extra weight.

Because desknotes are built on desktop components, they are cheaper than lighter machines which rely on purpose-built hardware. Extremely powerful, fast systems are available for less than \$3,000 with a large hard disk, 3GHz Pentium 4 processor and 512MB of RAM. If you favour power over portability, any of these machines will serve you well.

Dell Inspiron 9100

Dell's Inspiron 9100 features a massive 2GB of RAM, 60GB hard disk and a 3.4GHz Pentium 4 processor. These components help drive the 9100 to 19.5 under Business Winstone 2004 and 26 in Multimedia Content Creation Winstone 2004. It falls down under battery testing, managing just under two hours under BatteryMark.

A Radeon Mobility 9700 offers near-desktop video performance. The 15.4in screen, running at a native resolution of 1,900 x 1,200 pixels, offers clear, crisp images.

The 9100's three large internal fans run quietly and cool efficiently. It weighs 4kg, but is great for multimedia apps. Support for 802.11a/b/g wireless and Bluetooth come standard, as does a one-year warranty.

Details

Contact	Dell
Phone	1300 303 107
Online	www.dell.com.au
Price	\$3,799

✓ Powerful; good graphics.

✗ Battery life.

Verdict ★★★★★

IBM ThinkPad G40

IBM's G40 is based on a 3GHz Pentium 4 processor, 512MB of RAM and a 60GB hard disk. A Business Winstone 2004 score of 14.6 is matched by a Multimedia Content Creation mark of 19.9. Bluetooth and 802.11g wireless support are bundled, as is a Teac DVD/CD-RW combo drive.

A native screen resolution of 1,400 x 1,050 pixels is offered by the onboard video controller. Video performance is adequate for DVD playback, but the 4:3 aspect ratio is disappointing.

Although the machine weighs just over 4kg, the ThinkPad G40 tops two hours and 40 minutes in BatteryMark testing, which is an outstanding result for a desktop replacement.

Price	\$2,749

✓ Battery life.

✗ Onboard video.

Verdict ★★★★★

Toshiba Satellite P20

Toshiba's Satellite P20 features a 3.4GHz Pentium 4 processor, 1GB of RAM and an 80GB hard disk. The notebook weighs 4.3kg and is comfortable to type on. It manages two hours and 26 minutes under BatteryMark — an excellent result. A GeForce FX Go5700 processor, 17in wide-screen display, Harman

Kardon speakers, a remote control, FireWire and USB 2.0 ports are all present. Gigabit LAN and 802.11g Wi-Fi and Bluetooth are available and a Matshita DVD writer offers optical storage.

The system achieves 19.1 under Business Winstone 2004, and 19.5 under Multimedia Content Creation Winstone 2004.

At \$5,499 it's not cheap, but is considerably future-proofed.

Verdict ★★★★★

Mobile Media Center

One of the big drivers for desknote purchases will come later this year with the introduction of Windows XP Media Center Edition 2004 to the local market. Tier-one vendors are already marketing wide-screen notebooks bundled with TV

tuner cards, remote controls and a copy of Microsoft's lounge room OS overseas, so it's only a matter of time before they reach local shores.

Several are already available in the US, including Toshiba's Qosmio line of purpose-built Media Center notebooks. The Qosmio is designed to enable users to quickly view DVDs or TV without booting to a full OS. HP is offering Media Center 2004 on its Pavilion zd7000 wide-screen desktop replacement overseas, while Dell's Media Center competitor, Media Experience, comes pre-installed on its Inspiron notebooks.

Microsoft is yet to officially announce which vendors will be offering Media Center on portables in Australia.

Small form factor PCs

Mini PCs offer the ultimate blend of style and power.

Nick Race looks at four small form factor barebones kits.

Small form factor (SFF) systems have been selling like hotcakes as they're small, stylish boxes that don't look out of place on a desk or in a lounge room.

There are disadvantages with these small systems, as some models can't accommodate more than one hard drive, thus missing out on RAID functionality. Extra storage may also be an

issue. Most only have room for one optical drive, reducing an expensive DVD burner's lifespan.

Historically, choosing components for SFF boxes has required a lot of research, as many wouldn't accept top-end video cards or full-length PCI cards. Today's models are more forgiving, but check the dimensions of any cards before buying.

All units reviewed here are Pentium 4-based, and ship with the case, power supply and motherboard. AMD-based barebones units are also available to fit Athlon XP or 64 CPUs.

ABIT DigiDice

The DigiDice is a little different to other small form factor boxes, being more of a blend of desktop and mini PC.

The box incorporates a dial capable of overclocking the machine when required. In practice, however, it amounts to a gimmick.

The DigiDice is a capable system built on the i865 chipset. It has room for two optical drives, two 3.5in drives and a built-in 6-in-1 card reader.

It ships with InterVideo WinCinema and WinRip, both of which work with keyboard-like quick start buttons.

Benchmarks of 3,574 under PCMark04 and 19.5 under Business Winstone 2004 are acceptable.

Details

Contact	Altech Computers

Price	\$310

✓ Room for multiple hard drives.

✗ Gimmicky overclocking dial.

Verdict ★★★★★

AOpen XC Cube AV EA65

AOpen's EA65 is specifically built for home theatre and AV purposes. The front of the unit features VCR-style control buttons, along with the usual USB and FireWire connectors. It's built on the Intel 865G chipset, with support for Pentium 4 processors up to 3.4GHz.

The system is bundled with InterVideo Home Theater software and a remote control. It also utilises Intel's InstantOn technology, which reduces the time it takes to boot the machine by placing it in hibernation mode.

Scores of 3,699 in PCMark04, 27.5 in Multimedia Winstone 2004 and 21.2 in Business Winstone 2004 show the EA65 is no slouch when it comes to performance.

Price	\$710

✓ HTPC functionality and software.

✗ Only fits one hard drive and one optical drive.

Verdict ★★★★★

Shuttle XPC Zen ST62K

The smallest unit in this roundup, the Zen forgoes a typical internal power supply for an external power brick. It offers support for Intel Pentium 4 processors up to 3.4GHz, one hard drive, one optical drive and either a floppy drive or 6-in-1 card reader. A single PCI slot is available.

Shuttle has utilised ATI's RS300 chipset with integrated Radeon 9100 graphics. Though unable to be upgraded, this system is superior in performance to the Intel Extreme Graphics 2 found on the other boxes tested.

A PCMark04 score of 4,048 and Multimedia and Business Winstone results of 25.6 and 19.8 respectively show the Zen is ideal in a home entertainment setup.

Price	\$599

✓ Ultra-quiet; good performance.

✗ Minimal expandability; no AGP.

Verdict ★★★★★

Soltek QBIC EQ3401M

Soltek's EQ3401M is based on the Intel i865 chipset, allowing Pentium 4 support up to 3.4GHz and two DDR slots. An 8x AGP and single PCI slot are available, while the Intel Extreme Graphics 2 chipset provides entry-level graphics. There's room for a 3.5in hard drive, a floppy and two optical drives. The front panel holds two USB 2.0 ports, FireWire, plus headphone out, mic in and optical out for audio. PC-cillin, VirtualDrive 7, RestoreIT 3 Lite, Partition Magic 6.0 SE and Drive Image 4 are bundled.

Its 3GHz Pentium 4 processor and 512MB of DDR400 help it score 3,691 in PCMark04, 26.1 in Multimedia Content Creation 2004 and 20.2 in Business Winstone 2004.

Lexar storage has size and speed on its side

Lexar designs digital storage devices that get the ultimate performance out of your digital cameras or consumer devices. The products include the most popular formats such as CompactFlash™, SmartMedia™, MultiMediaCards™, Secure Digital™ cards, xD-Picture Cards™ and Memory Stick™.

What sets Lexar apart are the speed features it builds into its technology. Catering for the professional and power user, the Pro line of CompactFlash (CF) cards can record data at up to 80x, or a whopping 12Mbit/s. With speed like this, even multi-megapixel digital cameras will store data as fast as you can press the button. The professional range also incorporates Lexar's Write Acceleration (WA) technology, enabling compatible cameras to store images even faster.

Solid state storage is not just about speed. A professional just wants to keep on shooting and not worry about how much space is left on the CF card. Lexar has an answer for that too. The 40x range of CF cards for professionals ramps up to an amazing 8GB per card, the biggest in the world. That's plenty for even the most trigger-happy photographer at the highest resolutions.

Not everybody is looking for the highest speeds or massive amounts of storage. That's OK too. Lexar has a range of CF cards for every user from speeds of 40x down to 4x, and in sizes from 64MB to 4GB. All of Lexar's CF cards come with a minimum of five years limited warranty, with the faster cards supported by a limited lifetime warranty, perfect to protect your investment.

Not all cameras and devices use CompactFlash, and CompactFlash isn't all that Lexar creates. Lexar MultiMediaCards are the small, convenient and durable data storage solution for use in a variety of digital applications. These small yet powerful media cards are designed to interface with an array of digital devices designed to support the MultiMedia and Secure Digital card format, including PDAs, cellular phones, digital video recorders and digital cameras. Lexar's MultiMediaCards come in a range of capacities to suit your storage needs.

Secure Digital (SD) is becoming more and more common in mobile phones, PDAs, MP3 players and digital cameras. Lexar has stepped up to the plate with its range of standard and high-speed SD cards for every use. Standard cards are available in 64MB to 256MB models. Speed is

important, especially to a power user. Lexar has a range of high-speed 32x SD cards in sizes from 256MB to a roomy 1GB. Get snapping!

Most digital appliances, including Sony's MP3 audio recorder, rely on the Lexar Memory Stick format for getting data on and off the device. Being locked into a one-vendor solution can be a nightmare at times. Thankfully, Lexar also make a range of Memory Sticks in the standard format, plus the Duo and PRO range.

Lexar's standard Memory Sticks come in a range of sizes from 64MB up to 256MB, the perfect companions for your Sony digital camera. In the Duo range, Lexar's memory sticks are available in 64MB and 128MB. With built in MagicGate DRM compatibility, protecting commercially valuable digital images or music is easy.

For advanced users, Lexar's range of Memory Stick PRO cards is available from 256MB to a spacious 1GB. Also available in the PRO range is the Duo-enabled storage cards, offering MagicGate™ support in 256MB and 512MB capacities.

Lexar's Memory Stick also lights up when data is being written to it by your device, avoiding any unintended loss of data.

Lexar has also played it smart with its range of SmartMedia storage cards, which are available in sizes of 64MB or 128MB. Your digital camera will love the speed available when storing high-quality digital pictures.

The range of xD-Picture Cards for Olympus' digital camera family manages to squeeze fast and reliable storage into a minuscule size, and are available up to 512MB. Using your Olympus camera's advanced functions, such as panorama mode, is fully supported.

Lexar's stable of digital media cards and accessories can perfectly complement your digital devices. Even professionals can find ultra-quick results, increased data reliability and a lifetime warranty to suit the demanding nature of their requirements.

www.lexarmedia.com.au

Fast colour laser printers are here

With a tradition of manufacturing high-quality business and consumer level printers and Multi-Function Centres® (MFCs®), Brother has now created the HL-2700CN colour laser printer for businesses.

Back in the old days, laser printers were expensive to buy and run. Only businesses that could truly justify the expense of a colour laser owned a machine. Today, high-quality colour laser printing is accessible to a much wider range of businesses and individuals. Adding colour and life to documents, graphs, charts and key points in that all-important report is now the norm. Brother's range of colour laser printers are the ideal tools to enhance business communications, and include the HL-2700CN network colour laser printer.

The HL-2700CN produces the clear, high-quality results that only a laser printer can bring to your business. Outputting full-colour laser prints at up to eight pages per minute for colour means staff won't be standing around waiting for their printouts. The HL-2700CN can also print in black and white at 31 pages per minute, making it an ideal replacement for your current workgroup laser printer, with the added benefit of clear and crisp colour output.

That clear output comes from the printer's 2,400 x 600 dpi printing resolution. This will ensure that all your documents are printed accurately and have a professional finish when presentation is paramount.

Speed isn't the only benefit of the HL-2700CN, which has a wide range of accessories such as memory enhancements, built-in fonts and barcodes. Add the paper handling options that allow duplexing and large paper trays, and the HL-2700CN can grow with your requirements. Supplied as standard with a 250-sheet tray, the HL-2700CN offers expansion up to 780 sheets, reducing the hassle of replacing paper when you're in a rush.

Front-accessible toner replacement makes changing the unit's consumables fast and easy. Combined with the user-friendly printer software, even the most technically naive employee will be able to keep the HL-2700CN up and running, putting less of a burden on IT resources.

With a base memory of 64MB, upgradable to a whopping 576MB, the HL-2700CN will print even the most complex document in no time. Do away with a standalone print server with the HL-2700CN's built-in 100baseTX Ethernet network card. The printer's Ethernet card means print jobs are transferred to the HL-2700CN quickly and with a minimum of fuss.

Brother's HL-2700CN printer comes with an excellent pedigree. Supporting PCL6, PCL5C and Br-Script3 PostScript Level 3 Language Emulation, it prints standard-based text and documents in Windows or Macintosh network environments with ease.

The printer is shipped with comprehensive and powerful network management software, taking further stress off harried IT staff who can administer the machine from their desks. This is especially beneficial for larger networked environments, or off-site support where getting hands on a piece of equipment can be difficult or time consuming.

Ringling an internal IT department is a luxury not every business has. The high cost of bringing a consultant or technician onsite to fix a small problem can be a nightmare to smaller businesses. Brother runs a help desk service for their range of printers, and getting help with your colour laser is just a phone call away. Combined with a national network of trained technicians, the help desk will ensure your printer is always up and running.

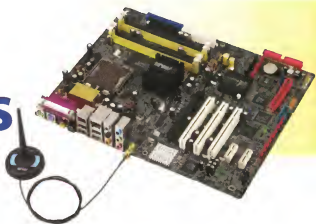

If there's no hurry, or if you prefer a hands-on approach, help and troubleshooting information is also available on Brother's support Web site at <http://solutions.brother.com>.

For a printer, it all comes down to print quality, speed and reliability. Brother's HL-2700CN colour laser printer has these in bucket loads. With crystal clear colour prints at 2,400 x 600 dpi, up to 31 pages per minute in black & white and eight pages per minute in colour, plus support at your fingertips, you can't go wrong. The best part is the price tag. At \$1,399 there's no barrier to adding a little colour to your business.

www.brother.com.au

Speed Section

ASUS P5 motherboards take the lead

To take advantage of the speed boosts in the new PC architecture, it's important to find a motherboard engineered from the ground up for performance.

It's an exciting time in the PC industry: Intel's new higher-performance processors are out, and both the PCI Express bus and DDR2 RAM are offering unprecedented system bandwidth.

But all motherboards are not made the same – it's worth doing a little research before buying a board based on marketing claims alone.

ASUS' new P5 motherboards deliver impressive performance, and are ready for Intel's next-generation CPU, based on the LGA775 socket (which flips CPU sockets on their head, with pins on the motherboard and connector pads on the CPU).

Intel is pushing out the new CPU architecture aggressively, pricing LGA775-based chips at about the same levels as the old Socket 478-based processors as an enticement for end users and the industry to make the leap quickly.

PCI Express (PCIe) is fully integrated into every P5 board. On the midrange and high-end models, multiple PCIe X1 slots offer 250MB of bandwidth in each direction per channel, compared to the tardy 133MB shared bus speed of PCI. On models that offer it, the PCIe X16 slot gives video cards a massive bandwidth of up to 4Gbit/s, up from the 2.1Gbit/s speed of AGP 8X.

ASUS engineers have also squeezed extra performance out of Intel's 915 chipset by unlocking Intel's maximum 533MHz memory bandwidth to a full 600MHz DDR2 RAM bandwidth.

There's also an obvious focus on high-performance networking with Gigabit Ethernet on all models except the most basic board. In the Premium models, ASUS also has the industry's first integrated 802.11g wireless networking, along with dual Gigabit Ethernet ports. One of the two ports sits on the new PCI Express bus, allowing for substantially greater Ethernet performance than older boards that ran the port through the 133MB/s shared PCI bus.

Connectivity takes full advantage of Intel's new PC architecture. In addition to the now-standard complement of eight USB 2.0 ports,

the Deluxe variants come with 400Mbit/s FireWire for connection of digital video cameras. The Premium models also have blisteringly fast 800Mbit/s FireWire for connection to external hard drives.

If you're after the maximum speed possible for external hard drives, the Premium motherboards also come with PCI brackets that have external Serial ATA (SATA) connectors, allowing you to run a drive external to the PC with absolutely no performance penalty.

On most models, there are multiple RAID controllers. On the top model, for instance, there's SATA RAID built into the Southbridge, a PCI SATA RAID controller and a PCI Parallel ATA RAID controller for backward compatibility.

The P5 motherboards also come with stunning eight channel high-definition sound for 7.1 surround gaming or home theatre.

Where the P5 boards clearly stand out from the competition is the range of ASUS exclusive technologies developed to help enthusiasts optimise their systems.

The fanless motherboard is the dream of most PC users. ASUS has developed a heat spreader called "Stack Cool" that takes the place of noisy fans, conducting heat away from high-temperature transistors and large capacitors on the motherboard, reducing heat by a full 10 degrees.

There's also a WIFI setup wizard, which makes the normally tedious process of setting up a wireless network straightforward. With a couple of clicks, you can set up the wireless network ID, WEP encryption and pick the best transmission channel automatically. Then, the wizard will set up Microsoft Internet Connection Sharing to allow you to connect other PCs rapidly.

A fascinating new feature is AI NOS (no-delay overclocking system), which allows you to safely overclock your PC without rebooting. The system constantly watches system load, and if you're coming close to CPU capacity, overclocks dynamically to get extra performance.

AI NET2 allows you to diagnose your network connection before booting into your operating system. You can also see exactly where a cable fault lies; for example, the Virtual Cable Tester can tell you that the cable is failing 8.13M from your PC.

The upshot of all these features? ASUS' P5 motherboards are a great buy. They're packed with features and performance-boosting technologies that will let you make the most of the industry's latest PC architectures.

Double-layer burning hits speed records

ASUS has released a double-layer DVD burner that can write four hours of video in less than half an hour.

Double-layer DVD burning is great in concept: the huge capacity makes storing uncompressed DVD movies easy, but what's the point if they take two hours to burn?

ASUS' latest multiformat DVD writer, the DRW-1604P, breaks through the speed barriers that first-generation double-layer burners suffered, now offering the industry's leading speeds.

It records double-layer (DL) discs at 4x speed, allowing 8.5GB of data (four hours of DVD-quality video) to be written in around 25 minutes.

Single-layer discs (both DVD+R and DVD-R) write at 16x speed, allowing a full disc burn in less than seven minutes. And, unlike earlier DVD burners, CDs don't take a speed hit either: the DRW-1604P can write to CD-R at 32x.

Availability of media is an ongoing problem, with the hardware industry constantly leapfrogging media manufacturers in the speed stakes. ASUS has solved this problem by building overspeed burning right into its drives. ASUS engineers have thoroughly tested which 8x single-layer media can be safely burned at 16x (and likewise, 4x to 8x and so on).

The same applies with DL media, and many brands of 2.4x DL media can be safely burned at 4x. Having this functionality built into the drive takes the guesswork out of overspeed burning, and removes the need to do dangerous firmware hacks.

Importantly, ASUS' dual-compatibility feature creates dual-layer DVDs that can be played or read by most DVD-ROM drives and DVD players.

There are also a number of ASUS technologies that will make your burns more reliable. FlextraLink, ASUS' optimised buffer underrun prevention technology, prevents discs from being turned into coasters if your computer momentarily stops sending data.

But you probably won't need FlextraLink very often, as the DMA-66 interface of the DRW-1604P is twice the speed of most other drives, which are still running at DMA-33. DMA-66 feeds the drive with data at the maximum speed possible over the PCI bus, allowing the drive's inbuilt 2MB buffer to be kept full at all times.

The Double Dynamic Suspension System II (DDSSII) provides a second layer of suspension cushioning for the recordable media, dramatically cutting vibration from the spindle motor, and resonance between components in the drive as well as the PC case. DDSSII makes tracking and focusing even more precise, improving burn quality markedly.

The most revolutionary feature of the drive is the Liquid Crystal Tilt (LCT) laser technology, which instantly and constantly adjusts the laser angle for both reading and writing, overcoming slightly uneven disc surfaces and curvature often found in recordable media. Only the most expensive media has close to ideal flatness, so LCT allows you to use different brands of media without worrying about checking their reputation for perfect flatness first.

The benefits of LCT can be easily seen. Often overlooked as a buying criteria, error correction quality on the DRW-1604P is simply extraordinary. Specialist optical drive and media testing site CDRInfo said: "The drive showed a remarkable ability to correct errors and reached the 5th level with 3/5 score - that is one of the best performances we have ever seen from a PC drive."

Finally, ASUS FlextraSpeed (Flexible and Strategic Speed Switch Technology) always chooses the best recording speed for the media you're writing to. It effectively lowers operation noise, prolongs motor life and saves CPU resources.

The bundled Nero Express burning software provides the industry's leading burning solution, rather than the limited offerings created in-house by some optical drive makers. It provides a straightforward and reliable interface for burning data, music, videos/pictures, an entire disc, or a disc image.

If you're looking for the best burning performance, you won't find a better drive than ASUS DRW-1604P. You'll be hard pressed to find another drive with 16x DVD+R, 16x DVD-R and 4x DVD+R DL in one drive, coupled with technologies that allow you to burn with exceptional data integrity.

Water-cooling kits

How we tested

All kits were installed on an Athlon 2800+ CPU on a Leadtek K7NCR1BD Pro 2 motherboard. Units with adjustable fan speeds were run at maximum. Temperatures were monitored and logged by Motherboard Monitor 5.3.7.0, (on this month's cover CD set).

Each kit was run for 30 minutes with the CPU idle until the temperature stabilised, except in the case of the Zalman Reserator 1, which ran for one hour before the temperature was steady. The processor was then run at full load until the temperature stabilised. The ambient temperature in the APC Labs was a constant 20°C.

Water-cooling is the ultimate way to eliminate heat from a machine.

Nick Race installs and tests seven kits designed to help your PC chill out.

Traditionally, the integration of water-cooling into computer systems was restricted to the overclocker market. The biggest enemy of running a computer outside of its specification is heat, so the adoption of water-cooling by those who push PC technology to its limits is no surprise. But these days, CPU temperatures rise with every generation of chip. Using closed water circulation cooling kits to move heat away from hot processor cores and into a radiator where it can be cooled quietly and effectively is the way of the future.

The faster a fan spins, the louder and more high-pitched it becomes. Space is limited in the areas of a PC where most of the heat is generated (the CPU, power supply and graphics card), so fans are driven at higher speeds to keep the temperature down. Water-cooling avoids this problem by transferring heat to an area where it can be cooled with larger and quieter fans.

Sony was the first to adopt this technology in a mainstream desktop computer, though Apple

recently claimed that water-cooling was first used in its Power Mac dual G4 2.5GHz system as a fan-free solution to controlling the processor's temperature. In design terms, water-cooling kits come in two varieties — those designed for maximum heat dissipation and those built primarily with noise reduction in mind.

Typically, a water-cooling kit consists of a pump, radiator, reservoir, and a water block that attaches to the CPU. Flexible PVC or silicon piping is also included to connect the components. Most include fans to aid heat exchange at the radiator.

Worth a look

Putting many processors together in a small space creates substantial heat. HP has invented a novel way of handling overloads by adapting a print head cartridge that sprays coolant onto toasty chips (www.hpl.hp.com/news/2002/apr-jun/cooling.html).

Corsair HydroCool 200ex

Corsair's HydroCool 200ex is a stunning performer that works by cooling water using an aluminium radiator and a huge 150mm high-speed fan.

Installation is more complex than fitting a standard CPU cooler. Pipes and a thermal probe are fitted to its thin, copper-based CPU block in manufacturing, and mounting mechanisms for K7, K8 and Pentium 4 processors are provided. A small PCB designed for mounting in a PCI slot cover connects to the thermal probe and a small set of wires links to the power headers on your motherboard. Lastly, a 12V connector from the power supply provides electricity to the unit.

A serial DB9 cable connects the PCB to the cooling unit. Water tubes are fed through holes in the PCB's mounting brackets that also join the cooling unit. Once filled with water and the provided coolant, the system starts up in conjunction with the PC. Non-drip fittings on the back of the unit make disconnecting the pipes connected to the PC painless, though small amounts of fluid can leak out.

The external unit is very basic, with plain

industrial styling. A red LED shows the current CPU temperature, and alarm and shut down limits can be set via the front panel. The whole unit is designed to be transportable, with a handle embedded into the top of the case.

The HydroCool 200ex kept the test system at a maximum temperature of 36°C under full CPU load, making it eminently suitable for keeping high-end and overclocked PCs from overheating. This excellent result is due to the large radiator and high-powered pump. Though it's not quiet when running in Turbo mode, the noise its standard operating speed generates is similar to that from fans in high-end PCs.

Given that the Prescott-core Pentium 4 processors have a Thermal Design Power of over 115W of dissipated heat compared to the Northwood-core's maximum output of around 90W, the requirements for keeping processors within operating parameters are becoming significantly more demanding. Though the Corsair HydroCool 200ex is no quieter than traditional cooling methods, its outstanding ability to control the temperature of the CPU make it hard to ignore.

Price	\$470

Outstanding cooling performance; portable.

Noisier than other units; no easy way to check the water level.

Verdict

3R Poseidon

The Poseidon from 3R is the rogue of this bunch, with the poorest cooling results and a "silent" pump that rattles loudly during operation. It's a pre-built, self-contained unit similar to the Silent Stream (see page 66), but nowhere near as efficient.

Installation is as simple as the Silent Stream's, using a spring-tensioned screw to keep good downward pressure on the aluminum water block. The tiny reservoir and aluminum radiator can be mounted either externally or internally in the PC case, depending on the space available. This would be a handy self-contained cooling system if the 3R's results weren't so poor.

The 3R Poseidon kept the test system's CPU at 47°C when idle, which is several degrees higher than any other in this roundup. Under a full load, the kit maintained the CPU at a steady 50°C, a temperature more in line with the stock air coolers provided with processors. These elevated temperatures can be attributed primarily to the system's poor water flow.

Price	\$139

Easy installation.

Poor performance.

Verdict

Global WIN Jefi

If nothing else, the Jefi boasts a unique design feature — the reservoir can house plastic fish or other underwater decorations. A submerged mains-powered pump propels water through the aluminum copper-cored CPU block, and then drips the water down several plastic teeth. Further cooling is achieved with a semi-submerged circular heatsink.

Installation of the unit is a chore and the quick install instructions are next to useless. A clearer manual is bundled on CD, but the entire process is time-consuming.

The Jefi's cooling unit doesn't include any temperature readouts, but does contain a rudimentary fan controller and a glass thermometer. However, power users will prefer some sort of advanced monitoring or readout.

It works reasonably well, keeping the test system at an idle temperature of 32°C and a maximum 42°C under load. The Jefi is suitable for users with moderate demands, though performance enthusiasts require a more efficient configuration.

Price	\$279

Looks stylish; works well.

Complex installation.

Verdict

Cooler Master AquaGate

The AquaGate provides plenty of options for power users. The brushed silver reservoir can be mounted internally or externally, and also includes a radiator and LCD control panel.

Installation of the unit is difficult, and it demands extra power from a mains source. The biggest problem is that the bundled PCI card includes a thermal probe for sandwiching between your CPU and the copper-based block. This is an effective way of measuring CPU temperatures, but it can lead to a damaged processor if care isn't taken during installation.

The AquaGate's LCD panel can be removed and inserted into the provided 5.25in bay cover, and the guts of the system can be mounted into a spare PSU port or other large space. Alternatively, the entire unit can fit into two 5.25in drive bays.

Keeping the test system at a respectable 34°C at CPU idle and a mediocre 43°C under full load, the AquaGate suffers from a slightly underpowered pump.

While a little tricky to install, the AquaGate is a self-contained kit that works well.

TERMS AND CONDITIONS

1. Information on how to enter and prize forms part of these conditions of entry. 2. Entry is open to all residents of Australia who subscribe or renew their subscription to APC between 8/09/04 to 12/10/04. Entry is automatic upon and subject to the correct use of a valid credit card or, if payment is made by cheque, the cheque must be cleared for payment. Subscriptions are to be sent by mail to APC, Reply Paid 3357, Sydney, 2001; or made by telephone on free call 136 116 or via the Internet at www.apc.magshop.com.au. Employees of the Promoter and their immediate families and agencies associated with this promotion are ineligible to enter. This offer is not valid in conjunction with any other offer. Only one entry per person per subscription. 3. Promotional period commences 8/09/04 and closes 23/59/04 on 12/10/04. All entries will be collated to go into the one draw to ensure that each entrant has a fair and equal chance of winning. The draw will take place at 11am EST at the Promoters premises on 15/10/04. The winner will be notified by mail and telephone (using contact details provided in the subscription) and their name will be published in the Public Notices section of *The Australian* on 19/10/04. Judges' decision is final and no correspondence will be entered into. 4. The first valid entry drawn will win a Brother HL-2700CN colour printer, valued at \$1,399. The next eight valid entries drawn will each win a Brother PT-2300PC labeller valued at \$299. Total prize pool is valued at \$3,791. Prize is not transferable or exchangeable and cannot be taken as cash. The Promoter is neither responsible nor liable for any change in the value of the prize occurring between when magazine is printed and the date the prize is claimed. 5. The Promoter may conduct such further draws at the same place as the original draw as are necessary on 9/2/05 in order to distribute the prize if unclaimed by that date, subject however to any written directions given under Reg 37 of the Lottery and Gaming Regulations 1993 (SAL). 6. The Promoter shall not be liable for any loss or damage whatsoever which is suffered (including but not limited to indirect or consequential loss) or for any personal injury suffered or sustained in connection with the prize except for any liability, which cannot be excluded by law. 7. The Promoter accepts no responsibility for late, lost or misdirected entries. The Promoter accepts no responsibility for prizes damaged in transit. 8. All entries become the property of the Promoter. 9. The collection, use and disclosure of personal information provided in connection with this competition is governed by the Privacy Notice (see contents page for location in this issue). 10. The Promoter is APC Publishing Pty Ltd (ABN 18 053 273 546) of 54-58 Park Street, Sydney, NSW 2001. Authorised under NSW Permit No: TPL04/08975; SA Permit No: T04/3392; ACT Permit No: TP04/3454; NT Permit No: NT04/10550.

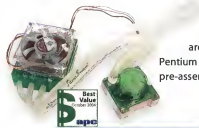

Global WIN Silent Stream

The Silent Stream is one of two sealed, self-contained units in this roundup. Consisting of a copper-cored aluminium CPU block with built-in pump, copper radiator and 80mm fan connected by soft silicon piping, the Silent Stream is as simple as water-cooling kits come. Installation is straightforward, being only slightly more

difficult than a fan-based CPU cooler, and the radiator can be mounted internally or externally.

A power switch is included, as are components for mounting on Pentium 4 and Athlon CPUs. The kit comes pre-assembled and filled with coolant, with a top-up every three months recommended. This makes the Silent Stream ideal for those who don't want to mess around with complex water-cooling solutions.

For a system with such a small water capacity and reservoir, it performs quite well. The Global WIN produced impressive results for a closed system, with a temperature of 40°C at idle and 43°C under load. This can be attributed to the all-copper radiator and quiet 80mm fan.

Contact	Com-Tek Computers
Phone	(03) 9329 2388
Online	www.com-tek.com.au
Price	\$149
✓	Reasonably quiet; inexpensive.
✗	Not the best performer.
Verdict	★★★★☆

ThermalTake Aquarius III

An external unit, similar to those from Corsair and Cooler Master, the Aquarius features two readout panels for the water tank and CPU temperatures measured by thermal probes. A fan speed controller and display are also built in. A side window shows the reservoir's water level and can be topped up when required. The system is extremely loud when running at high speed and barely noticeable at low speed; however, performance at this setting is poor.

The unit's water block is of the thin copper type, with mounting tools for K7, K8 or Pentium 4 processors. The mounting system for the K7 is questionable, though, as the water block can move under the clips. This could cause damage in transit due to the weight of the water pipes.

The ThermalTake system performs more poorly while idle than two of its rival coolers under a full load, keeping the test system's CPU at 39°C. Results under load are equally disappointing at 48°C, and can largely be attributed to the unit's low water flow.

Price	\$399
✓	Adjustable fan speed; excellent readouts.
✗	Poor cooling; pitiful water block retention mechanism.
Verdict	★★★★☆

Zalman Reserator 1

The Zalman is the only system in this roundup that doesn't use a fan. The Reserator 1 is completely passively cooled, and consequently the radiator needs to be much larger to compensate.

Measuring over 59cm high, the Reserator is an external finned cooling tower that sits next to a PC. It's not easily moved, but it looks great. Installation is as simple as fitting the water block and piping to the main unit, filling it with water, and then plugging it in.

An almost silent pump sits at the bottom of the tower, pushing water through the copper-cored aluminium water block, which fits Athlon and Pentium 4 CPUs. A flow indicator shows when the water is moving through the system, which is important because the piping is opaque and the Reserator quickly overheats if the water isn't flowing. The design works extremely well and runs almost silently — it kept the test system at a low 31°C when idle, and 37°C under load.

Features and specifications are subject to change without notice / Features shown vary between cases in the range

Ultra-portable projectors

Stephen Dawson examines 10 compact projectors, which ought to be a weight off the shoulders of the overburdened traveller.

How we tested

A Gossen Lunalite meter was used for measuring output levels and contrast ratio. Claimed ANSI lumen figures are listed in the specification table. All tests were conducted producing the same image size on an LP Morgan Galleria projection screen with a gain of one and a neutral white finish. We used an XGA output signal at 75Hz for computer images, and interlaced PAL component video (S-Video in one case) for DVDs. Each projector was calibrated using the video tests from the THX Optimizer DVD, including the use of a blue filter to check for the correct colour balance.

If you spend a lot of time on the road delivering presentations, you probably already know how valuable a tool a small projector is. A mobile professional's projector has a distinctive set of characteristics that sets it apart from the booming home cinema units.

WHAT YOU NEED

Projectors are available in two flavours: Liquid Crystal Display (LCD) and Digital Light Processing (DLP). The former shines light through a LCD panel to produce images, while the latter relies on an array of mirrors on a small chip called a Digital Micromirror Device (DMD). LCD technology is older, DLP produces clearer, brighter images.

There's little room in notebook bags once the computer, literature, charger and other gadgets are stowed, so the smaller the projector, the better. This Labs Challenge specified devices weighing 2kg or less. Testing showed some of them to weigh just over 2kg while others are well under the limit.

A projector has to compete with any ambient light in the room — this isn't home theatre, so you

can't rely on the presentation room being dark enough. The bigger the picture you want to project, the more powerful the projector's lamp will need to be.

As presentations will be shown in different environments with different light levels, you need to be able to easily adjust the size of the image to suit the room, as well as create realistic contrast and colour levels.

Just as you often won't be able to control where the picture will be displayed, you may not be able to choose an ideal surface for the projector to rest on. If your image ends up at an odd angle, keystone correction can get the picture looking square. Horizontal keystone correction is better still. However, keystone adjustment limits the effective resolution.

The device you choose should offer high resolution. These days, XGA (1,024 x 768 pixels) is the minimum you should expect.

The final feature to consider is inputs. VGA is standard, but DVI (Digital Visual Interface) or the M1 variant will also provide for the future. As some of these projectors will undoubtedly make the trip home on the weekends for watching movies, look for S-Video, composite and component inputs.

Hewlett-Packard mp3130

Details

Contact	Hewlett-Packard
Phone	13 23 47
Online	www.hp.com.au
Price	\$3,899

✓	High output: good video performance, flexible.
✗	Sharpness control doesn't work on component video.

Verdict

Hewlett-Packard's mp3130 combines style with excellent performance — instead of the standard flat block, it stands upright on a narrow base. Weighing 1.8kg and standing around 20cm high, it can be a little precarious to balance. Thankfully, a release key on the front springs out a pair of extension metal legs, which provide a stable, 15cm wide base. The extension legs cant the projector up by a maximum of 8°.

The lens has an adequate zoom range of 1:1.2. Both manual and automatic vertical keystone correction is provided. The mp3130 is the only device in the group to offer horizontal keystone correction. This permits the projector to be laterally off-centre from the screen if the occasion demands, while retaining a rectangular image.

The XGA resolution DMD is a "double data rate" version, which operates faster than regular models to give more precise graduations of illumination. A 12" mirror swing offers a higher contrast ratio by enabling the DMD to tilt towards or away from the light. An impressive figure of 1,800:1 is achieved in contrast ratio tests.

The mp3130 throws out a lot of light, equalling the Epson EMP-735 as the brightest of the products in the roundup at a calculated 10,509.7 lux from a white screen. With the colour depth offered by the DLP system, it has no difficulty producing a large and powerful picture even with moderate amounts of ambient light.

DVD-Video output is excellent, with stable pictures and no flicker from the interlaced signal. All 576 horizontal lines are distinctly traced on a vertical resolution test disc. In addition to 4:3 and 16:9 ratios, the mp3130 offers a 1:1 mode, which displays the picture without scaling. However, this function displays images in the 4:3 ratio only.

The main VESA M1-DA input accepts digital and analog computer signals as well as analog component video in standard and high definition. The sharpness control doesn't function with component video, although S-Video and composite work well.

The remote control acts as a mouse when the projector is plugged into the computer via USB, and has a laser pointer.

BenQ PB2220

BenQ's 1.8kg PB2220 does a great job of handling RGB material from a computer. It delivers a consistently bright and sharp image, with a very good contrast ratio of 1,600:1, despite the full-black test signal being slightly marred by a low level of random noise.

The projected image is thrown slightly upwards from the lens axis, permitting it to be kept below the line of sight of audiences. Manual vertical keystone adjustment is featured, but should rarely be required.

While the DLP rainbow effect is rather marked on PAL video, it's well controlled at 75Hz XGA, only appearing on mostly monochrome images.

The noise levels from this projector are

average, with noticeable whining from the single-DMD DLP colour wheel.

If you intend watching the occasional DVD, the PB2220 is not the projector for you. Video input handling is poor and makes the image appear out of focus. The projector's 1,024 x 768 pixels are well-focused, but its signal processing lets the machine down.

All connections are analog. However, BenQ is generous when it comes to cables, even bundling a component video-to-VGA lead. The remote control is a basic credit card-size type, lacking a laser pointer and providing no mouse control on the connected computer.

Details

Contact	BenQ

Online	www.benq.com.au
Price	\$3,849

✓ Bright; contrast ratio; good image with computer signal.

✗ Poor imaging on video input; low-level noise on black signals.

Verdict ★★★★★

Dell 3300MP

Tipping the scales at a comfortably portable 1.8kg, the Dell 3300MP is a solid little projector. It's fitted with a VESA M1-DA socket for all high-quality signals, and an LCD panel on the top indicates what's going on. The M1-DA accepts analog computer signals, digital signals (via DVI-to-M1 adaptor cable) plus component video, including high definition.

A hinged flap on the remote control covers a number of subsidiary keys. When closed, the remote operates the mouse on a USB-connected computer; when open, it reverts to the traditional remote control function.

Producing a huge image in a smallish room is

problematic since the projector has a long throw. Automatic vertical keystone is available.

The Dell 3300MP performs well with analog XGA signals. There's plenty of range in the controls to boost colour for large screens, and sufficient brightness to operate efficiently in large rooms with moderate amounts of ambient light.

DVD-Video viewing is also well handled, with the projector delivering interlaced signals in the progressive scan format.

Switching between inputs is slow — the projector pauses for five seconds on each input lacking a signal before acknowledging another press on the Source key.

Details

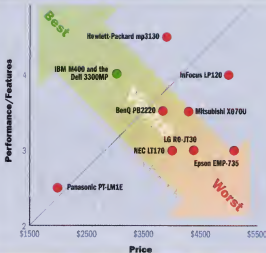

Contact	Dell
Phone	1300 303 107
Online	www.dell.com.au
Price	\$2,999

✓ Good brightness; good general imaging.

✗ Flimsy remote control; slow input changes.

Verdict ★★★★★

apc price-to-performance ratio

Although the HP mp3130 stands head and shoulders above the pack in terms of performance, the IBM M400 and Dell 3300MP offer the best blend of power and price. Both retail for \$2,999 and produce clear, bright images ideal for presenting in a well-lit environment.

Get shorty

You can do it with mirrors too. NEC's WT600 (\$11,500) eschews the lens to provide an extremely short-throw mirror-focused image — positioning the unit just 65cm from the screen produces a 2.54m display. More details can be found online at www.nec.com.au.

Epson EMP-735

The EMP-735 uses LCD panels to create its image, resulting in a low contrast ratio (measured at just 320:1), though this shouldn't matter too much for presentation work. More importantly, this projector ranks equal first for output brightness, with a calculated reading of 10,509.7 lux from a white screen.

The bottom of the image displayed by this projector is lower than the centre line of the lens (15cm for a 2.54m diagonal image). This means the projector must be situated on a high stand or tilted upwards to get a full image in the viewing area. As an alternative, the automatic keystone adjustment function can be used, but this reduces the effective resolution.

Epson's projector uses a credit card-size remote control which slips into a convenient holding bay on the projector's body for safekeeping. However, the remote offers no extras, such as a laser pointer or mouse control.

The 2kg EMP-735 features a PC Card slot and is supplied with an 802.11b PC Card, so you can drive the projector from your computer, eliminating the need for wiring.

DVD playback, however, isn't up to scratch. There is marked vertical jitter when fed with an interlaced 50Hz video signal, and progressive scan processing is lacking.

Oddly, the fan on the review projector runs even when the unit is in standby mode.

Details

Price	\$5,099 (\$4,599 for wired EMP-730)
✓	High output; wireless operation; PC Card support.
✗	Image projected below centre; low contrast.
Verdict	★★★★☆

IBM M400

At a light 1.2kg and measuring just 5.7 x 18.3 x 17.4cm, IBM's M400 is the second smallest unit on test. It's arranged just like a regular projector only smaller, and sports a corporate-friendly matte black finish.

Performance is strong in all areas except brightness tests, in which the M400 ranks last due to a low-power lamp. The high contrast ratio — measured at 1,800:1 — is the result of the XGA digital micromirror device. This is one of the newer DDR models with a wider, 12° swing of its micromirrors, similar to the Hewlett-Packard device. Manual vertical keystone adjustability is offered if required.

The other three projectors reviewed here

which support digital video use the VESA M1 connection. IBM has stuck with the slightly more compact DVI-I, which supports both analog and digital inputs. A separate USB port is provided for computer connection, so the projector's laser pointer-equipped remote control can also act as a mouse if required.

Except for the M400's brightness limitations, which may hamper large displays in environments with lots of ambient light, picture quality is strong, with excellent colour rendition. Video handling isn't quite so proficient, though, with limited horizontal resolution. In a dark room, a slight halo is evident around the display area, suggesting inadequate control of internal reflections.

Contact	IBM
Phone	13 24 26
Online	www.ibm.com/au
Price	\$2,999
✓	Size and weight; good contrast.
✗	Limited brightness level.
Verdict	★★★★☆

InFocus LP120

The InFocus LP120 is the smallest and lightest unit in this roundup, measuring 5.3 x 24.9 x 9.8cm and weighing just 980g. If maximum portability is your primary requirement, look no further.

This XGA DLP projector also benefits from the new DDR DMD, making it the clear winner on contrast ratio at a measured 2,000:1. The LP120 features a small bulb to limit the amount of heat emitted which adversely affects brightness, with a calculated white screen lux measurement of 5,632. This measurement indicates that the LP120 is best used in environments where the amount of ambient light can be controlled.

A VESA M1 socket accepts both analog and digital computer signals. The supplied analog

adaptor cable also features a USB plug. The "remote control" has just four keys, one of which operates the laser pointer, while the two arrow keys are limited to paging through PowerPoint presentations. The remaining Effect key can be assigned to one of a number of useful functions. All truly effective control of the projector is performed through the bank of backlit buttons on its top, supported by a two-line LCD panel.

Despite its diminutive size, picture sharpness is excellent, as is colour and picture stability for computer input. Interlaced video signals, however, show an irritating amount of jitter. As there's no support for component video, the LP120 is not really suitable for watching DVDs.

LG RD-JT30

There's a special surprise feature on the LG RD-JT30 — a Faroudja DCDi. Dealing with the tricky task of deinterlacing video, Faroudja DCDi is perhaps the most highly regarded video handling circuitry on the market, appearing in home cinema projectors costing as much as \$40,000.

It does an excellent job of removing "jaggies" from DVDs, even in the difficult-to-handle NTSC format. But for all that, both the vertical and horizontal resolution are a bit disappointing, with finely spaced lines barely distinguishable.

It performs solidly via computer signals, with decent downscaling, although the picture is better at the native XGA resolution. At 990:1, the contrast ratio is relatively low for a DLP projector,

and a reasonable amount of speckly video noise comes through on a totally black signal.

The brightness is nowhere near the highest of these projectors, but adequate for medium-sized venues with low levels of ambient light. However, the RD-JT30's boardroom presentation credentials are bolstered somewhat by the inclusion of VGA, S-Video and composite inputs.

One good design feature is the recessed lens, which enables the user to pack it into a notebook bag without being concerned about damage.

At 1.8kg, the LG unit is compact and offers good performance, but there are no new boundaries broken here. While this projector is not ideal for presentations, it is one of the better machines in this roundup for watching movies.

✓	Faroudja DCDi deinterlacing; good overall image.
✗	Low contrast ratio and brightness.

Verdict ★★★★★

Mitsubishi XD70U

Mitsubishi's XD70U allows a big picture to be projected from very close range thanks to a lens which offers the shortest throw of any in this roundup. In our tests, it achieves a 2.54m diagonal picture at a distance of just 2.64m.

Even more impressively, the short throw isn't achieved at the expense of quality. The XD70U produces the third brightest output in this roundup at a calculated 9,805.6 lux on a white screen, and an excellent 1,900:1 contrast ratio. This combination means that it's almost as effective in a display area with high levels of ambient light as it is in a pitch-black dedicated viewing room.

Signal handling is limited to analog video, but Mitsubishi has included a USB port anyway so that

the laser pointer-equipped remote control can operate as the connected computer's mouse.

The short throw doesn't seem to adversely affect screen coverage, and sharpness is retained across the whole display area. The power on tap, combined with a good DLP implementation, makes for top-notch picture quality with the computer, although jitter is evident from a 50Hz interlaced video signal from a DVD.

Projectors weighing less than 2kg were specifically requested for this Labs Challenge. However, contrary to Mitsubishi's claims of it weighing 4.4lbs (just under 2kg), the XD70U actually weighs in at 2.1kg, making it the heaviest unit in the roundup.

Price	\$4,290

✓	Short throw lens; high output; good remote control.
✗	Heavy; jitter on interlaced video signals.

Verdict ★★★★★

NEC LT170

NEC's 1.9kg entry certainly stands out from the crowd. It looks a bit like a log, being nearly 30cm long, with a lens at one end and connections on the side. A sliding lens protector, similar to those often found on compact digital cameras, is also present.

The LT170's engine employs a 12" DDR DMD in XGA resolution. But it's a little underpowered in the lamp department, coming in towards the lower end of the units tested in brightness, managing 6,469.5 lux on a white screen. Nor is the measured 630:1 contrast ratio exceptional.

Like the Epson EMP-75, the base of the projected image is below the level of the lens (15cm down for a 2.54m display), so audience view may be obstructed. Physically tilting the

device is the only solution to this problem, but thankfully automatic vertical keystone adjustments will keep the picture square.

The LT170's zoom range is just half that of most projectors, making it suitable only for fine adjustment, something could be an issue in a cramped presentation room. The remote control works effectively but offers no extra facilities such as mouse control.

Some provision for interlaced video signals has been made by including a "Flicker Reduction" option, and this works effectively. The overall image quality is little better than average when presenting video material. However, images sent from a computer are delivered with excellent colour and sharpness.

Price \$1,999

Automatic vertical keystone correction.

Low resolution: low contrast; image projected below centre.

Verdict ★★★★★

Panasonic PT-LM1E

Panasonic's PT-LM1E is the only unit on test to offer a native resolution of 800 x 600 pixels. This is well below the XGA standard and a huge strike against the compact 1.6kg unit.

The Panasonic projects the bottom of the picture below the level of the lens — 22cm down for a 2.54m screen — which means it must be placed fairly high or tilted upwards to get a viewable image. While both manual and automatic vertical keystone correction are offered, adjusting it reduces the effective screen resolution, something this projector can't afford.

Image quality is average: the projected image is uneven, with a white screen appearing slightly pink on the left and right sides, and blue in the

middle. DVD playback is also poor, with images appearing blocky due to the low resolution.

Surprisingly, the horizontal resolution is adequate, accurately handling a 720 horizontal pixel test pattern. Unfortunately, the same can't be said for the vertical resolution. Significant detail is lost due to the mere 450 viewing lines available (the PAL format delivers 576), and there is noticeable jitter on interlaced PAL signals.

Computer signals fare better, but are still marred by the large size of the pixels. Although the PT-LM1E offers reasonable brightness, and is the cheapest projector here, a contrast ratio of just 400:1 and the low resolution of the display earns the PT-LM1E the wooden spoon.

Sub-\$2,200 small business servers

With demands on IT infrastructure at an all-time high, **Matthew Overington** examines four servers pitched at small businesses.

How we tested

While all vendors in this roundup offer an OS with their servers, this Labs Challenge levels the playing field with a limit of \$2,200 for hardware alone. We installed Microsoft Windows Small Business Server 2003 on each system and tested them with 10 client PCs.

But these machines aren't limited to running Windows. Linux-savvy network administrators are free to install a server-grade Linux distro like Red Hat or SuSE (see "Alternative operating systems", on page 77).

Points were awarded for server-class features like hot-swappable drives, tool-less entry, system locks, room for expansion and manageability.

Small servers are becoming increasingly popular for businesses looking to consolidate resources and get the most out of their IT budgets. Many small businesses or workgroups add servers to their networks to help share files and resources, or even to serve mail.

The machines in this roundup are suitable for small workgroups of up to 20 people, but overkill for a home environment. If you're looking to share a few files on a home network, try hunting down a bargain at a swap meet or on eBay.

Some enterprise server features like automatic failover and redundancy aren't required at this level, though monitoring features are welcome for busy system administrators. Although downtime isn't a massive concern on a small business

system, it's still important to select a machine that's easy to maintain or add drives and RAM to as your requirements expand. After all, it's becoming extremely difficult to work if your networks and servers aren't up all the time.

Features such as tool-less entry and management software make life easier for administrators and help minimise downtime if something goes wrong.

Although \$2,200 is a meagre budget for a server, you'll be pleasantly surprised at the range of solid features to be found at this level. Serial ATA hard drives are the norm, and while most vendors have opted for Pentium 4-based units, Hewlett-Packard has upped the ante by building up a Xeon-equipped screamer that even boasts a 36.4GB 10,000RPM SCSI hard disk. The HP unit is short on memory but is an excellent example of the sort of powerful machines available to small business at an entry-level price.

Dell PowerEdge 700

Dell's winning entry features a desktop processor that's been tweaked to fit a server platform.

The PowerEdge 700 is built on a 2.8GHz Pentium 4 processor running on an 800MHz frontside bus. This provides a solid base which is backed up by 512MB of 400MHz dual channel ECC memory in two 256MB modules. The ECC RAM, while a little slower than conventional memory, provides error checking and offers extra stability over regular DDR.

A server's storage requirements can be extreme, so it's disappointing to see Dell spec a single 40GB Serial ATA hard drive. Thankfully, it has included an Adaptec dual channel Ultra160 SCSI controller and three empty drive bays so more high-speed disks can be added.

The case is lockable and features thumbscrew entry, and all the drives sit in a removable caddy. The motherboard includes three PCI-X and two PCI slots, along with a spare Serial ATA connector, so there's room for expansion. It also has a floppy drive, a vital consideration as most RAID drivers and BIOS updates still require the use of floppies.

In terms of connectivity, Dell includes an Intel Pro/1000 Server Ethernet adaptor and an integrated Gigabit Ethernet controller. This provides a fast connection to the office backbone along with the option to segregate networks directly from the server.

All the machines in this roundup ship with CD-ROM drives—a considerable oversight given that many MSDN software packs ship on DVDs. DVD-ROM drives are only a little more expensive than CD-ROM drives, and there's little reason to include outdated drives.

Dell rounds out its outstanding feature set with 24-hour telephone tech support and a one-year, next-business-day parts and onsite labour warranty, an important consideration if the server is going to form a key part of your network infrastructure. This warranty doesn't extend to weekends, though Dell also offers a parts exchange service for a total of three years.

Although the review machine ships without an OS, Dell includes its OpenManage and Server Management Software Suite, which enables system administrators to manage and configure the server quickly and easily. This is important if an administrator is running the server in addition to performing other duties in the office.

At \$1,909, the PowerEdge 700 is a solid offering. It easily manages a client load of 10 connected PCs and is up to the task of running as a small Business Exchange or Notes server. Though serious buyers will need to up-spec the drives before considering using the machine as a file server, there's plenty of room inside the case for growth.

✓	Solid foundation; plenty of room for growth.
✗	Small hard disk.
Verdict	★★★★★

Acer Altos G310 Series

Acer's entry looks more like a desktop PC than a server and offers very little in the way of dedicated server technology. The system is built on a 2.8GHz Pentium 4 processor and features 1GB of Apacer memory consisting of two 512MB modules in a dual-channel configuration. Unfortunately, Acer has opted for quantity over security, as the memory doesn't offer error checking.

There are two 120GB Western Digital Serial ATA drives fitted and the motherboard offers Gigabit LAN and Serial ATA RAID 0 or 1, with five spare PCI slots. Unfortunately, the system doesn't offer a PCI-X slot, which might be an issue for those who want to add a high-speed SCSI controller as there are no spare Serial ATA channels. CD-ROM and floppy drives round out the features.

The case features a lock and thumbscrews, and a quick release drive bay holds up to four hard disks. Despite the five free PCI slots on the motherboard, the system relies heavily on onboard functions, which tie up CPU resources during operation.

Acer's EasyBUILD and Server Manager software are available as optional extras to help configure and manage the machine, and a fantastic three-year onsite warranty with round-the-clock phone support provides a level of insurance for busy administrators.

In conclusion, the Altos G310 system isn't as expandable as some of the other servers in this roundup, but the warranty is enough to save the machine from a poor score.

Price	\$1,999

✓ Generous storage; excellent warranty.

✗ Poor future-proofing.

Verdict ★★★★★

ASUS AP130-E1

On paper, the ASUS AP130-E1 looks much like the Dell PowerEdge 700. The system is based on a 2.8GHz Pentium 4 processor running on an 800MHz frontside bus. It includes 512MB of ECC RAM in a single-channel configuration, though the motherboard supports dual-channel memory.

This machine relies on an onboard Gigabit Ethernet adaptor as its only network connection, which ties up some CPU resources. Thankfully, ASUS compensates with the dual 80GB Seagate Serial ATA hard disks. An onboard RAID controller provides RAID 0 or 1, offering performance or redundancy at the expense of CPU time. Both CD-ROM and floppy drives are fitted.

The case features a lockable front panel and thumbscrews for the side panel. Clips hold the

drives in place, and there are two free hard drive slots for future expansion. Two PCI and two PCI-X slots are also available.

ASUS's System Web-based Management (ASWM) 2.0 is included, a system which allows the administrator to control the server from another desk in the office, or even over a remote connection. A Trend Micro Server Protect antivirus licence is also included, along with a one-year onsite warranty. This covers any problems experienced during business hours, and Cassa offers a next-business-day replacement on parts.

Although the ASUS AP130-E1 offers superior storage capacity over Dell's PowerEdge 700, the significantly better warranty and dedicated SCSI adaptor ensure that the Dell wins out.

✓ Two 80GB hard disks.

✗ Reliance on onboard functions.

Verdict ★★★★★

Alternative operating systems

One important factor when shopping for a server is the type of operating system you want to run on it. The machines in this roundup can all be supplied ex-OS, but it's generally cheaper and easier to go for a hardware and software bundle. The cost will vary based on your needs, so discuss them with several hardware providers.

Generally, most small businesses will want to run with Microsoft Windows Small Business Server 2003, but there are plenty of other choices out there for small business environments, including Novell Netware and server-grade Linux distributions.

Novell (1800 244 364) offers an evaluation version of NetWare 6.5 at www.novell.com/products/netware/eval.html, and the retail version is \$1,685 for five users.

Options for those who prefer Linux are almost endless, but larger vendors like Red Hat and SuSE can provide critical support for small businesses. SuSE Linux retails for US\$349 per year for a 2-CPU server. A 30-day trial of Enterprise Server 9 is available at www.novell.com/products/linuxenterpriseserver/eval.html.

Red Hat's small business option, Red Hat Enterprise Linux ES, from \$649, is distributed

Red Handed: Linux is also a viable OS for servers.

by Ingram Micro (1300 653 333) and is also available from www.apac.redhat.com.

Price	\$2194.50

✓ Powerful hardware; room to grow.

✗ Small hard disk; meagre RAM.

Verdict ★★★★★

Hewlett-Packard ProLiant ML150

Hewlett-Packard's ProLiant ML150 is a unique system that's every bit a server. The motherboard features two CPU slots and sports a 2.8GHz Xeon processor, leaving one free for future expansion. Six RAM slots are present, as are onboard IDE and SCSI adaptors. There are no Serial ATA slots, though the system has four spare PCI-X slots and a single PCI slot, so it's easy to add another hard disk controller. This is a great option for administrators on a budget, as Serial ATA hard disks are much cheaper than their SCSI counterparts.

The case offers thumbscrew entry, and a caddy holds the drives in place. Floppy and CD-ROM drives are included for applying updates.

HP has skimped in a few areas in order to provide a system which is the easiest to upgrade

of all those in this lineup. The ProLiant ML150 features a single 256MB ECC RAM module and one 36GB 10,000rpm SCSI Ultra 320 hard disk. While the other machines in this roundup have 300 to 350W power supplies, this server ships with a massive 450W unit, offering plenty of juice for additional hard disks.

A one-year onsite warranty covering parts and labour is included, along with a two-year parts warranty. A well-rounded software suite helps to manage and configure the server.

In its raw configuration the HP is very fast and offers plenty of room to grow. If you currently have moderate server requirements, but can see your business — and its demands — growing in future, this is the machine for you.

Do Amazing Things
On your new PC.

Ask the experts

Considering an upgrade to Serial ATA? Or maybe you'd like to build an ultra-quiet PC, but want to know which components are best.

The APC Labs team brings you its expert opinions and answers your upgrade questions.

PC overhaul

With bottlenecks banished, Serial ATA upgrades are finally worthwhile when building a new PC, explains Asher Moses.

Instant expert

- Best used with PCI Express boards.
- Longer cables are ideal for larger cases and external drives.
- Lack of jumpers makes configuration easier.
- Speed demons should wait for SATA II.

Serial ATA II

The increased bandwidth of Serial ATA II is definitely worth waiting for if performance is of particular importance.

Boosting speeds from 150MB/s to 300MB/s in total, SATA II will also include a port-multiplier feature allowing up to 15 drives to be connected to a single controller, support for external drives, and native command queuing for more efficient execution of instructions.

Performance plus: Serial ATA promises high speed data transfers with minimal interference.

A fast hard drive is mandatory for applications that frequently access large files such as video editing and gaming. However, unlike two years ago when 7,200rpm ATA133 drives were standard, the decision is slightly more difficult today. At a maximum theoretical bandwidth of 133MB/s, Parallel ATA (PATA) technology has just about reached its peak, and hard drives are fast becoming a bottleneck on PC performance.

Enter Serial ATA (SATA). Introduced in 2001, SATA has now firmly established itself in the market as the next drive interface, but is worth the upgrade?

SATA utilises a serial link for transmitting and receiving data, while PATA drives send data in simultaneous, parallel routes. This creates a number of issues, the most serious being the increased risk of run-time errors over long distances since data isn't sent in a constant stream. Thus, the maximum cable length for ribbon cables on PATA drives is 45cm, while SATA cables can be up to 1m.

Initially, SATA controllers were attached to the ageing PCI bus, which plagued system performance as its peak theoretical bandwidth was a meagre 133MB/s. Therefore, regardless of how fast the drives could send or receive data, the strong reliance on the PCI bus meant that a performance cap was inevitable.

Today PCI Express is beginning to take control, offering a minimum bandwidth of 2.1GB/s, making it ideal for use with SATA drives. The fact that support for the standard has now been integrated into most recent Southbridge designs means that the PCI bus is now a non-issue.

In its current form, SATA offers few performance incentives over PATA, but there are many other benefits that make it an obvious choice for those building a new system from scratch. While it's also an ideal upgrade for PATA users, if you're

Got a question?

Need the power of the APC Labs team? Send your questions to upgrades@apcmag.com in fewer than 150 words. For performance-related questions, provide a full rundown of your system's relevant specifications — CPU, RAM, motherboard chipset, GPU and so on.

purely after performance, it may be worth waiting for Serial ATA II (see "Serial ATA II").

Serial data can be transferred over longer distances (ideal for use with external drives and large cases), but can also run at much higher speeds without posing any risk to data synchronisation or being affected by external noise. The first SATA iteration boasts a maximum theoretical bandwidth of 150MB/s, which isn't a huge advantage over the 133MB/s offered by PATA drives (although most are only capable of reaching 100MB/s). However, SATA bandwidth figures are set to reach 600MB/s by 2007.

Perhaps the trump card of serial technology is the fact that it requires very little configuration. With PATA drives, users had to go through the trouble of setting the master/slave jumper when two or more drives shared the same cable, resulting in the already minimal bandwidth being shared by both devices. Conversely, SATA is point-to-point, meaning that each device is connected to the host via a direct link. This effectively minimises the overhead caused by co-ordinating accesses between the master and slave device sharing the same cable.

Other noteworthy features of SATA include hot-swapping (the ability to insert and remove drives whilst the system is in use), lower voltage requirements (0.5V as opposed to 5V on PATA) and the airflow/cable routing advantages resulting from the marked difference in cable width.

Serial ATA on DVD?

Serial ATA wasn't designed purely for internal hard drives, and there are a number of other mass storage SATA components on the way (though the only devices announced so far are DVD drives). These include:

DVD-ROM/RW

CD-ROM/RW

Tap devices

Zip drives

Silence of the fans

Need a Panadol to play with your PC? Asher Moses explains how an improved cooling system and quieter components can save you a headache.

Try and sleep with seven fans roaring away at 7,000rpm, and you'll understand why silent PCs are a godsend. They're also useful for recording music and watching DVDs. Lounge room systems used for DVD playback are a prime example — the constant whirring of a fan can ruin the suspense of a good thriller. Fortunately, there are a number of ways to make your box quieter.

CPU

If possible, try to obtain a unit that comes with a fan speed controller. This will allow you to manually adjust the speed to a suitable setting that's both quiet and effective in your particular environment. Anything up to 2,500rpm is fairly muted, but it's possible to get fan speed down to about 1,300rpm while maintaining adequate cooling performance.

Secondly, try a copper heatsink, as copper is a more efficient conductor of heat than aluminium. A product that embodies all of these features is the Zalman CNPS7000A-Cu, which can be purchased for \$55 from PC accessory reseller PCCaseGear (www.pccasegear.com). Zalman also manufactures a fanless heatsink for total silence, the CNPS6500B-Cu.

While you're at it, take a look at the smaller fan on your CPU's Northbridge. These can be replaced by fanless heatsinks such as the Zalman Northbridge Cooler for under \$15.

GRAPHICS

Graphics cards are another major source of PC noise, as owners of the GeForceFX 5800 Ultra can attest. Try a heatsink with a heatpipe, such as Zalman's ZM80A-HP, which does away with fans altogether. ATI Radeon cards are far quieter — owners of these cards may see little reason to upgrade.

POWER SUPPLY

The power supply is the second loudest source of noise behind the CPU cooler. Generally, units with a single fan run louder than those with multiple fans, as it's required to spin much faster to give the same effect. Manufacturers such as Thermaltake, Antec,

Maxpower, Enermax and Zalman all offer effective silent PSU solutions, opting for larger heatsinks and slower fans to minimise noise. These can be purchased from online retailers such as PCCaseGear and AusPC Market (www.auspcmarket.com.au).

QUIET CASES

With fan usage reduced, the choice of case is crucial — there must be sufficient airflow and case fans in order to avoid overheating. Antec's Sonata, which sells for under \$200, is a good example of an enclosure designed specifically for quiet computing. It features hard drive brackets with rubber grommets to absorb vibration, two 120mm low rpm fans at the front and rear for intake and exhaust, and a bundled Antec TruePower silent PSU.

If you don't want to upgrade your entire case, swap small, high speed case fans for larger, slower ones that cut down on noise. Pansonic's PanaFlo Ultra Quiet 80mm fans are almost inaudible at 21dB and sell for less than \$20. As with the CPU fan, purchase a couple of fan speed controllers for each case fan. Controllers such as Zalman's Fan Mate are cheap (around \$11) and effective, while a more elegant method is the rheobus/fan bus, which slides into a spare 5.25in drive bay and can control up to four fans. You'll need to spend around \$30 for a quality unit.

DRIVES

Hard drive speeds are also important in reducing noise. With the average hard drive spinning at upwards of 7,200rpm, it's important to choose a manufacturer that has quiet computing firmly in mind. One such manufacturer is Seagate, which adopts Fluid Dynamic Bearings as opposed to the traditional ball bearings used in the majority of hard drives. As a result, Seagate drives are virtually silent, emitting no more than 24dB when running in silent mode.

As a final note, all of the aforementioned techniques must be used in combination for best effect — none will be entirely effective in isolation. [UTSA](http://www.utsa.com)

A mighty wind: large, slow fans are quieter than small, fast fans.

Instant expert

- Fanless heatsinks for the CPU, graphics card and motherboard components are silent yet reduce heat.
- Large, slow fans are quieter than small, fast fans.
- Enclosures with maximum airflow and minimum case fans are crucial when reducing noise.

Draining water now

Enthusiasts with deep pockets and a willingness to get their hands wet may want to invest in water-cooling units, which while being more expensive and tricky to set up, are as quiet as a fanless heatsink and far more effective. Water-coolers come complete with mini pumps and tiny PC versions of car radiator grilles. Prices range upward from \$300. Check out our Labs Challenge on page 62 for reviews of a range of DIY kits.

Next month

Sound cards: unjumbling THX, EAX and other sound card features.

Music to your ears: Antec's Sonata is a good example of an enclosure designed specifically for quiet computing.

Extreme DVD burn

A full DVD burn in close to six minutes? APC shows you how to get there using the fastest drives, upgrade hacks, a step by step guide to ripping, extracting, and more.

Take a close look at your DVD drive: Is it hiding some important secrets? For the growing number of hard-core enthusiasts now upgrading their drives with downloaded firmware upgrades, the answer is yes. And for those trying DVD hacks, the pay-off is potentially even bigger.

While hacking isn't for everyone — at worst, you risk ruining your drive permanently — those willing to take the chance are discovering that this black art can yield fantastic results, not least the ability to upgrade from 4.7GB discs to 8.5GB without buying a new drive, not to mention faster speeds and better disc compatibility. Who knew your trusty DVD burner could perform such feats?

For an idea of just how popular DVD hacking is, visit www.cdfreaks.com, which bills itself as the world's largest CD and DVD "community". There you'll find links to official firmware upgrades, information about Double Layer hacks, news on triple format burner technology and, most importantly, forums where DVD drive owners debate the merits of flashing a Lite-On drive with Sony firmware.

In short, DVD burning is growing into an enthusiast's game that's not just for speed and capacity freaks. If you're anything like us, you probably find yourself asking questions like "How do I extract VOB files?", "Which file format should I use?" and "Can I upgrade my burner?" It's a classic example

of a computing technology that seems relatively simple, but in reality requires navigation through a constantly expanding labyrinth of file formats, technologies and compatibility issues.

This guide to extreme DVD provides you with the information to deal with these issues, as well as the inside story on how to burn faster and better.

DOUBLE YOUR CAPACITY

The big news is that some of today's standard single layer drives are eminently hackable, making it possible to upgrade their burning capability from 4.7GB to 8.5GB. Our guide to upgrading drives starts on page 84.

If speed's not your top priority, Double Layer drives allow up to 8.5GB of data to be written to a single disc. The technology employs two separate dye layers sandwiched between slivers of plastic in the disc media. Once a Double Layer burner reaches the capacity of the first dye layer, it simply refocuses the laser, passing through the first layer and recording to the second layer.

But it's not just the underground hacking community pushing the upgrade message. Major drive manufacturers are backing the concept as a route to better disc compatibility and speeds.

In particular, a lack of media is pushing drive manufacturers to be creative in their approach. Pioneer is verifying which 8x media can be successfully burned at 16x. The company's new 16x DVR-A08XLR drive (see review on page 52) includes media ID codes that match with 8x discs and can be burned at a whopping 16x.

"The end user is going to have to do a few firmware upgrades along the way, but we think it's the best way of managing it now, given that 16x media won't be available until the end of this year at the earliest," says Pioneer's national sales manager for business systems, Simon Bartlett.

THE SIX MINUTE BURN

For those after bleeding edge speeds, the good news is the final 16x DVD+RW

specification for drive and media makers. Although such discs hadn't gone on sale at the time of writing, Verbatim says the new format allows data to be written at an amazing 21MB/s.

Philips, one of the first manufacturers to announce its 16x drive, says a 4.7GB disc will burn in less than six minutes — almost the maximum speed optical drives are capable of sustaining.

As the Philips technology boffins explain: "[Burning] becomes increasingly

difficult at higher recording speeds, because the available time to heat and cool the dye at the position of a mark becomes shorter."

According to the company, the challenge is to

avoid heating adjacent data blocks and inadvertently erasing them due to the high laser power required to write in extremely short pulses.

Other speed increases are also around the corner for first generation Double Layer burners, which can take up to 45 minutes to complete 8.5GB burns. Pioneer is taking a leaf from DVD drive hackers' handbooks, burning to the just-released 2x DVD+R DL media at 4x. The company's new \$329 DVR-A08XLR drive allows 8.5GB DVD+R DL burns to be completed in a mere 27 minutes. It's a sign of what lies ahead for Double Layer speeds in the future.

William Maher and
Dan Warne

Manufacturers are pushing for better compatibility and speeds

Extreme burning

DOUBLE LAYER: TWICE THE CAPACITY

Double Layer drives allow 8.5GB capacity burns — large enough for two to three hours of video without compression. But at 4x maximum speed, they're slower than single layer and discs cost about \$15 each.

16x DRIVES

The fastest optical drives on the market, with full 4.7GB burns achievable in around six minutes. Manufacturers say it's about as fast as DVD writing is going to get because of the limitations of DVD media.

MULTIFORMAT DRIVES

Don't buy a drive that will only write to -R or +R media. Quality burners that can write to all formats (except DVD-RAM) sell for less than \$200.

UPGRADE HACKS

Common mods include uncapped DVD ripping speed, overclocked burning, writing to 4x media at 8x speed and transforming single layer drives to Double Layer.

TRIPLE FORMAT BURNERS

Burners of the future will be able to write CDs, DVDs and Blu-ray discs using just one optical pickup. These drives start hitting the shelves from 2006.

The future: Blu-ray, HD-DVD and the 50GB disc

The future of DVD, particularly for recording space-hungry high-definition television (HDTV), is in high capacity blue-laser DVD technologies. And it's starting to look like a VHS versus Betamax-style showdown between Blu-ray and HD-DVD.

To date, only two Blu-ray recorders have been released for HDTV recording, and only in Japan. Both sell for around \$4,000. However, major PC makers Dell and HP have thrown their weight behind the format.

The Sony-backed Blu-ray format embraces MPEG-2 for video encoding but uses a 38% narrower blue laser to write ultra-high density data to the disc, boosting storage to 27GB on a single-sided disc and up to 54GB on a double-sided disc.

Toshiba and NEC's alternative format, HD-DVD, uses vastly more efficient video encoding — either MPEG4-AVC (Apple QuickTime) or VC9 (Windows Media). Capacity is only 15GB on factory-made discs or 20GB/32GB on single/Double Layer recordable discs, but a 15GB HD-DVD disc stores around 180

Winner takes all: Blu-ray and HD-DVD are about to engage in a war that will recall the days of VHS versus Betamax. And as we all know, the best technology doesn't always win.

minutes of high-definition video while Blu-ray discs only store 132 minutes. Microsoft is backing the HD-DVD format for Longhorn. HD-DVD recorders won't go on sale until 2005, but no word on sales in Australia.

Supercharge your burner

If you're not upgrading your DVD drive, you're missing its full potential. But what are the risks? Dan Warne investigates.

Upgrade your drive

It's easy to upgrade your burner with the firmware files on this month's cover CD. Use the drive analysing tools (such as Nero InfoTool) to determine your drive's exact model number, then match that to the updater on the CD. Copy the firmware updater from the CD to your desktop, remove the disc and run the updater.

The CD contains official firmware for the following brands: AOpen • ASUS • BenQ • BTC • Diamond • Data • Gigabyte • IomEGA • LG • Lite-On • Mitsumi • OptoRite • Panasonic • Pioneer • Plextor • Ricoh • Sony • TDK • Teac • Toshiba. WARNING: Although these firmware updates come from the manufacturers, modifying firmware is an intrinsically risky process. If it fails, your drive may become unusable.

Inside info

- The Firmware Page
www.rpc1.org

www.cdmediaworld.com
- DVDINFOPro
www.dvdinfo.pro.com
- CDR Labs.com
www.cdriabs.com

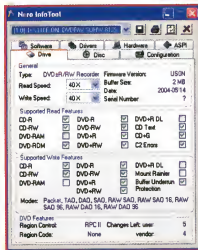

Firmware upgrades for DVD drives not only fix any disc compatibility issues, but in some cases they can also let you burn discs faster.

Manufacturers face an uphill battle of keeping their drives working properly with new brands of media and dye-layer types. The industry attempts to deal with this problem by embedding a "media ID" code in mass-produced blank discs. Burners then read this code and if it's recognised, adopt a factory-determined "writing strategy" for laser strength and write speed. If it isn't recognised, the burner takes a "best-effort" approach, which may result in burn errors. To find out your media's ID code, use Nero's freely-downloadable CD-DVD Speed tool. Under the Extras menu, select Disc Info. The information in the code field is the media ID.

With updated firmware, a drive has a better chance of making more successful burns, more often. To find the files you need, check the upgrade toolkit on this month's cover CD (see page 8 for the full contents). Also try the manufacturer's Web site, or take a punt on a region-disabled version at <http://RPC1.org> or <http://cdreaffs.com>. Keep in mind that if it's not the manufacturer's installer from the official Web site, you run the risk of ruining your drive. However, it's usually just a quick download and one-step update process.

THE RISKS OF DVD HACKING

The more adventurous may even consider hacking

WARNING: using non-manufacturer-approved utilities will void your drive's warranty. Be aware that modifying firmware is an intrinsically risky process. If the process fails, your drive may become unusable. You should not use these tools unless you are prepared to void your warranty and cause potentially irreversible damage your drive. The publisher, ACP Publishing Pty Ltd and its associates and affiliates, and its officers, agents and employees (collectively, "ACP"), accept no responsibility for any loss or damage, whether direct or indirect, arising out of or in any way connected with the use of these tools. The reader uses these tools at their own risk and indemnifies ACP for any such loss or damage.

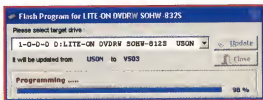

a drive. However, flashing hardware can turn your drive into an expensive paperweight. Remember that making these modifications will void your drive's warranty.

1 A Lite-On 812S drive was reflashed in the APC Labs to test the risks of a firmware hack. This was an 8x single layer burner which enthusiasts have reported successfully reflashing with the Double Layer 832S firmware.

Lite-On's official firmware updater won't "cross-flash" the drive with the superior model's firmware, but the "Code Guys" at DVD hacking forum RPC1 (<http://codeguys.rpc1.org>) provide freeware tools that work around these limitations.

2 The X-Flash-X tool allows the extraction of the Double Layer 8325 firmware from Lite-On's official installer, so there was no need to download pirated firmware. The official 8325 firmware version V508 was downloaded from www.apcmag.com/info/liteondvdfirmware and the binary file extracted using X-Flash-X.

At this point we “fixed” the firmware so it could be cross-flashed into a different drive. The CodeGuys OmniPatcher tool (<http://codeguys.rpc1.org/patchers.html>) is designed to help here. We loaded the extracted firmware

- 1 **Nero's InfoTool** provides all the information you need about your drive's specifications.
- 2 The appropriate firmware is downloaded and installed ready for flashing.

- 2** The appropriate firmware is downloaded and installed ready for flashing.

Extracting movies

Your friend has made a home movie on DVD, but you want to re-edit or make your own copy. Jarrod Spiga explains how to extract the video.

PROtip faster copying

CD and DVD drives have two modes of operation, Constant Linear Velocity (CLV) and Constant Angular Velocity (CAV). If your drive supports the latter, it will spin the disc at a constant rate regardless of where the laser is pointing to on the disc. As a result, data transfer rates are slower when the laser is directed to the beginning (middle) of the disc, and higher when the laser points to the outside. A CLV drive always transfers data at the same rate, slowing down the drive's motor as the laser moves towards the outside of the disc.

Both modes have advantages — drives that operate in CAV mode rip faster, but CLV drives tend to handle errors better. Therefore, if you're going to archive a large number of old and scratched DVDs, ripping with a CLV drive will take longer but will be consistently more successful than a CAV drive.

Inside Info

- DVD Demystified FAQ
www.dvddemystified.com/dvdfaq.html
- DVD Decrypter
www.dvddecrypter.com
- Doom9 DVD Structure Guide
www.doom9.org/dvd-structure.htm

Manufacturing defects, disc rot or an accidental scratch can quickly turn a DVD into an expensive coaster. As a result, you may want to back up your non-copyrighted DVD collection using your PC's DVD burner.

EXTRACTING THE DATA

With home DVD editing and authoring approaching the same level of sophistication as commercial DVDs, understanding how to extract video and convert the files requires serious expertise. It's now possible to create everything from titles and subtitles to chapters and sub-chapters on home-made DVDs (to learn more, take a look at the software on page 94). When backing up a DVD, however, you may decide you only want the main title, so there's little point in copying all the menu data. But which files contain what information?

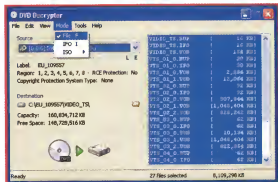

To start with, use DVD Decrypter (www.dvddecrypter.com) which lets you view, sort and copy across the relevant video files.

After installing the app, insert the disc containing the footage you want to copy into the DVD drive and load DVD Decrypter. Select the DVD drive and wait for the scan to complete.

1 By default, DVD Decrypter will run in File mode and a list of files will appear. This is where understanding the files on your DVD is crucial.

DVDs contains two directories — AUDIO_TS and VIDEO_TS. The former contains files for DVD-Audio discs, while the latter almost always contains a number of IFO, BUP and VOB files.

Information (IFO) files supply the DVD player with the navigation information for the title, such

1 A list of files contained within the VIDEO_TS directory will appear in the right pane. Select the files you want to copy.

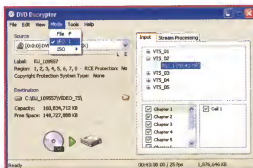

as chapter points and the location of audio and subtitle streams. Backup (BUP) files are copies of the IFO file and are used in the event that the IFO file is corrupted.

SEPARATING THE FILES

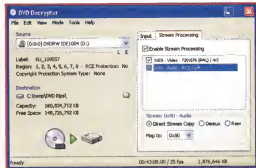

Video Object (VOB) files can contain any number of video, audio and subtitle streams. There might be multiple audio tracks multiplexed in these streams and several video sequences may also be stored. If you have a movie where scenes can be viewed from alternate angles, this stream can also be multiplexed into the same VOB file.

If the DVD was created using the standard DVD-Video format, the video will be encoded as an MPEG-2 stream with a maximum bit rate of 9.8Mbit/s. Audio streams are encoded in a variety of compression formats, including AC-3, MPEG-2 multichannel, MPEG-1 dual-channel and Linear PCM. Together, the audio and video streams must not exceed a bit rate of 10Mbit/s. A maximum of nine audio streams can be used.

In File mode, all files contained within the VIDEO_TS directory will appear in the right pane in DVD Decrypter.

2 If you have limited hard disk space, select IFO from the main menu. The right pane will display a tree of the titles available.

3 The IFO mode allows you to pre-process the stream as you're copying it. Choose the streams and remap them if necessary.

Is it legal?

The instructions on these pages are for non-copyrighted home movies only. While it's possible to extract video from commercial DVD-Videos (or any other copyrighted material), this is a breach of copyright and in doing so you risk prosecution. You should not attempt this.

DVD copying has always been a contentious issue. Some consumers believe they should be able to make a legal copy of anything they've purchased,

while artists and publishers see it as an excuse to create unauthorised pirated copies of their works.

Not only should you not duplicate copyrighted information, but these DVDs are protected with an encryption and authentication method known as the Content Scrambling System (CSS). CSS is used on most commercial DVDs in order to stop anyone from copying them in this manner. In essence, a CSS-encrypted disc

has a key that is located in a hidden sector. This key must be used in order to decrypt the data using special circuitry in a DVD player before streams can be decoded and displayed — or in this case, copied. If you copy the data directly from a DVD, that data will still be CSS-encrypted, and therefore unwatchable.

APC does not advocate the practice of circumventing CSS or any other copy protection schemes.

Because a DVD-Video can contain a number of titles, a player needs to identify each title. While a file's extension allows the player to identify what type of data it contains, the filename is used to separate titles.

The VIDEO_TS.* files are the first ones played when a DVD is launched. The other files make up each title. For instance, VTS_01_1.VOB contains video, audio and subtitle streams for the first title on the DVD. VTS_01_0.VOB is frequently much smaller than VTS_01_1.VOB — in this case, the former contains a set of navigational menus for that title, while the latter contains the actual title.

Video files are played in order. Once a player has finished streaming data from VTS_01_1.VOB, it jumps to VTS_02_2.VOB and so on.

Armed with this information, you can create any DVD-Video, as well as identify which portions of a DVD you want to extract. Look for the title that contains the most data — the more VOB parts there are, the longer the title. If you don't care how much hard disk is consumed, select and copy the whole lot of files.

ANOTHER WAY TO COPY

2 If you have a limited amount of hard disk space available, select IFO from the mode menu. The right pane should now display a tree of the titles available on your DVD.

Expand each title branch and identify the title

you want to copy. In most cases, you're looking for the longest title.

You may also deselect which chapters you'd like to copy, which is handy if you're trying to spread a short DVD across a number of CDs.

3 The IFO mode also allows pre-processing of streams as they're copying. On enabling this option, choose which streams you'd like to include and remap them if necessary. This is useful if the video has an extra commentary track.

4 After selecting the title(s) you want to copy, choose the target location. Create or select the directory where you want to copy the DVD data.

5 You should now be ready to rip, so hit the copy button. Watch for read errors during the ripping process and check that your DVD drive is operating at the correct read rate.

6 The resulting IFO and VOB files should be in the specified location. In the example, VTS_02_0.VOB is missing. This file contained the menu for this title, which we chose to strip. Also notice that due to stream processing, our rip takes up 1.46GB of hard disk space as opposed to the 2.08GB of space used on the DVD for the title.

Finally, make sure you've collected *all* the video files. If you accidentally skip any VOBs in the sequence you'll find a gap when it comes time to repackaging the video on your hard drive or on another DVD.

By ripping only the parts of the disk you need, you save time and valuable hard disk space.

One-step beginner's guide

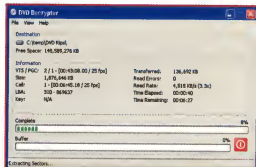

One-step tools such as DVD Shrink (www.dvdshrink.org) can copy, recompress and burn a home movie so that it fits on a regular DVD, or within a specified file size. Use this method if you're not interested in editing, manually compressing or converting your video to other formats like DivX for playback.

To do this, insert a DVD and load DVD Shrink. Click on the Open Disc button and select the drive that contains your DVD. The applet then scans the DVD for titles and menus. When the scan is complete, uncheck anything you don't want to copy and hit the Backup button.

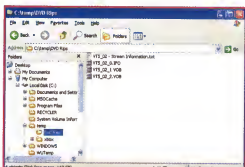

In order to save the compressed DVD, Nero Burning ROM must be installed (also included on this month's cover CD). DVD Shrink then passes data to Nero, allowing you to write directly to DVD±R/RW media, or to an ISO file on your hard drive.

4 Select the target location by clicking on the folder.

5 During the ripping process watch for read errors. Also check your DVD drive is operating at the correct read rate.

6 The resulting IFO and VOB files should be in the specified location when the rip process is complete.

Processing the video

Finding hard disk space for home movie DVD backups can be difficult. Jarrod Spiga shows you how to save space with different video formats.

PROtip large file sizes

By default, DVD Decrypter splits decrypted VOB files into 1GB chunks. But if you plan to edit VOB files, it's often easier to rip everything into one massive VOB file.

Be aware of the limitations of your file system. FAT16 and FAT32 volumes support a maximum file size of 4GB minus 1 byte. NTFS can take files up to 16T.

For this reason, it's best to rip DVDs to NTFS partitions in Windows 2000, XP or 2003. Windows 98 or Me users are limited to 4GB files.

Linux users should note that the maximum file size supported on ext2 file systems is 2GB, while ext3 has no such limit. Mac OS 9 users are limited to 2GB files, but Mac OS X supports 2T files.

DivX 3.x

✓ Stable; less problematic on dedicated hardware solutions; fast performance.

✗ Complicated to use; making a movie fit a certain size is difficult.

Xvid

✓ Open source; simple 2-pass encoding.

✗ Slow encoding; still under development.

DivX 5.x

✓ Free for private use; easy to use; compatible with previous DivX versions.

✗ Pro version comes with adware.

A complete DVD ripped to your hard disk can consume up to 9GB of space — a large amount, even considering the size of modern drives. If you can't write your backup to DVD, it makes sense to compress the backup into a different format in order to free up disk space.

Compressing a DVD isn't for everyone — most standalone DVD players aren't capable of playing DivX or Xvid files (although DivX support is appearing on some models — see APC July, page 62) and media centre PCs are still a few months away. However, if you have a PC with large screen (or a video card with TV-out) and a good quality sound system, you may prefer watching videos on your PC, where file formats are less of an issue.

WHICH FORMAT IS BEST?

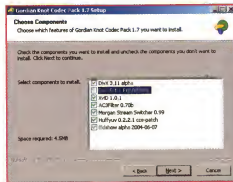

Each format has its advantages and disadvantages (see bottom left).

Although this walkthrough is based on the DivX 5.x codec, the steps are almost identical for any other codec.

OPEN THE TOOLKIT

Before you can compress a ripped stream, you'll need to have the right tools. There are dozens of apps involved, and each performs on its portion of the task at hand.

Hunting down each of these programs has traditionally been difficult, but the Gordian Knot packages make things much simpler. The Rip Pack contains all the tools for compressing video, while the Codec Pack includes all the audio and video codecs you need. Download them from <http://gordianknot.sf.net>.

1 If you don't want GAIN adware on your system, uncheck the DivX 5.11 Pro codec.

Start by installing the Rip Pack. The main installer launches separate child installers which allow you to specify more advanced installation options if desired.

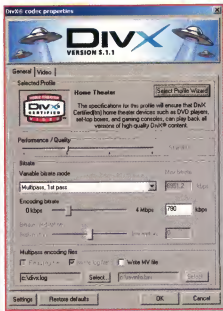

1 Next, turn to the Codec Pack. When it comes time to select the codecs that you'd like to install, stop. The DivX 5.11 Pro codec is supported by adware from the Gator Advertising and Information Network (GAIN). If you don't like the idea of installing adware, uncheck the box and install the standard DivX 5.11 codec from this month's cover CD.

Both the Pro and standard versions of the codec allow you to complete the task. The Pro version has a few additional features that can produce higher video quality at the expense of longer compression time. If preserving video quality is paramount, install the Pro version and be aware of its presence when you scan for spyware — removing the GAIN key from the registry stops the Pro version from working.

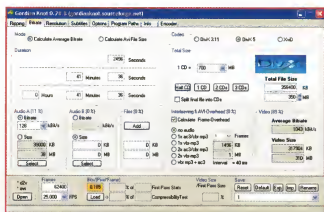

Once you've selected the codecs you want, the main installer will again launch multiple child installers to complete the task.

CODEC CONFIGURATION

Once everything has been installed, load Gordian Knot. The bit rate calculator will be displayed, but configure the codec first by clicking on the options tab followed by the First Pass button under the DivX 5 default codec settings section.

2 DivX profiles can be used to guarantee that your video will play without a hitch on DivX players.

3 Select the audio encoding bit rate. As with any compression method, the higher the bit rate, the better the quality.

2 If you want your video to play on a DivX-certified DVD player or portable device, ensure the profile you select matches the level of certification of the player. Set the Performance/Quality slider to your preferred setting, remembering that slower encoding usually produces a better quality video. Set the variable bit rate mode to Multipass, 1st pass and click on the video tab.

Psychovisual Enhancements is a fancy name for improving image quality on the areas of the screen that the eye typically notices, while reducing quality in the areas the eye does not. Enabling this setting is optional, but can help reduce file sizes. Crop and resize options should be disabled.

Hit OK and replicate the same settings under the Nth Pass button (with the exception of the variable bit rate mode — it should be set to Multipass, nth pass).

AVI ON THE FLY

The DivX encoder only compresses files in an AVI format. In order to convert ripped VOB files to AVI format, load the robot4rip app, located in the Gordian Knot program group in the Start menu. The Scan menu is the key to get started with this application — select the Scan Folder where the VOB files from your home video are stored.

The boxes that appear across the middle of the app indicate the different pre-processing steps robot4rip performs. If you've already extracted a single program chain (PGC), click on the PGC Rip button to disable this step. Hit the start button and let robot4rip create your AVI and D2V files.

UNTIE THE GORDIAN KNOT

Close robot4rip and bring up the bit rate calculator in Gordian Knot again. Click the Open button in the bottom left corner of the screen, and select the D2V file that robot4rip generated. Gordian Knot reads the number of frames within the feature and estimates the frame rate. Ensure this is correct, otherwise the bit rate calculations

will be out. PAL video streams are usually encoded at 25fps.

Gordian Knot should now display the feature's duration. Select the video codec for compressing the AVI file (DivX 5 in this case), and adjust the Total File Size to the amount of disk space allocated to the final product. Some handy presets are available here to make fitting the feature onto one or more discs much easier. If you plan to split the video over two discs, enable the Split final file into CDs option.

3 Select the audio encoding bit rate. Generally, 256Kbit/s is acceptable for high-quality video, but if you're cramped for space, lowering this to 128Kbit/s still produces good results.

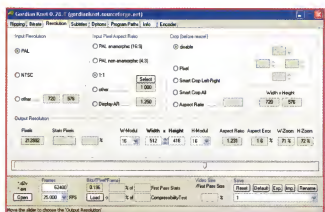

By now, you should be able to see what percentage of your file will be taken up with audio, video and overhead data.

4 Next, jump across to the Resolution tab. From here, you can crop your image and select the output resolution. When selecting the output resolution, keep an eye on the Bits/(Pixel*Frame) figure at the bottom of the screen — if it drops too far below 0.180, you'll end up with poor quality video. Naturally, as this figure increases, so does the image quality and the amount of space it takes up.

VIDEO SQUISH

Once you're satisfied, select the Add job button on the Encode tab. Gordian Knot will fill in the required values relative to the details entered in the bit rate calculator. Double-check the DivX 5 and Audio tabs to ensure compression settings are correct and add the job to the Encoding Queue.

Click the Start Encoding button. Encoding can take anything from a couple of minutes to many hours depending on the length of video and the number of compression passes you do. When it's all finished, test the end result and check the file size. With any luck, you'll be pleased with the results. If not, go back to the bit rate calculator and find a better balance.

4 Select the output resolution in the Resolution tab. As the figure increases, so does the image quality and the amount of space it takes up.

PROtip★
finetuning

Selecting the appropriate bit rate is imperative to achieving good quality backups of DVDs. The bit rate calculator in Gordian Knot does a good job of automatically configuring the codec for compression, but it takes practice to get the best results.

In general, enter settings that you don't want to compromise on first, then adjust the less important things. For example, if you must keep a 720 x 576 resolution, reduce the audio quality to 128Kbit/s instead of 256Kbit/s in order to get a 45 minute video to fit on a 700MB disc.

Even if you have to process your files three times to get the right setting, it will be worth it.

Moving VHS to DVD

Are your old home movies still on VHS? Jarrod Spiga demonstrates how to bring your collection into the digital age.

Many people purchase a DVD writer with the intention of copying their entire home movie archive recorded on analog video tape to a digital format. But burning the end product is only the final step — before you can burn, you need to capture the video.

STEP 1 — CAPTURE CARD

Getting video onto a PC is more difficult than many people realise. Firstly, you need to have a video capture device on your PC. A number of video and TV tuner cards feature analog video inputs — if you have such a card, chances are that it also came with video capture software. Otherwise, you'll need to acquire a video capture card or shell out for a new video card. Keep an eye out for cards that feature both video in and video out (sometimes referred to as VIVO).

STEP 2 — CONNECT VIDEO

The second hurdle is that of port type. Most capture devices feature S-Video inputs, and if your camcorder or VCR doesn't have an S-Video output, you may not be able to transfer the video. If your card has RCA inputs, video can be captured from just about any source but the quality won't be as good as that captured with an S-Video connection.

STEP 3 — CONNECT AUDIO

The final hardware consideration relates to sound. To minimise audio quality loss, a dedicated sound

card should be used. For the best results, be sure to disable any audio inputs on the card before capture.

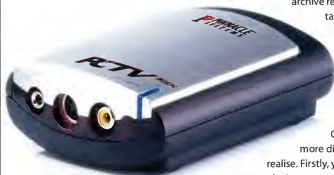

Owners of DV camcorders have another trick up their sleeve. Provided that your PC features a FireWire 400 port, most video editing software should be able to capture directly from the camcorder. You may even be able to connect other devices to your camcorder, using it as a video relay device. But do keep in mind that quality is slightly reduced with every device the footage passes through.

STEP 4 — AVOID FRAME DROPS

The trouble with analog capture is that the system must have enough resources to capture every single frame as it's displayed — generally it isn't possible to slow down the player to allow your PC to catch up. For instance, if another application on your system accesses your hard drive while a capture is in progress, frames may be dropped. Similarly, if there are insufficient CPU resources at the time of capture, more frames will be dropped.

In some cases, the capture software may be to blame — try an alternate capture package to eliminate this. In most cases, however, you'll need to identify the system bottleneck and rectify the problem. Some steps you can take in order to minimise dropped frames include:

- Rebooting your system just before you start a capture session.
- Minimising the number of applications running when capturing.
- Defragmenting hard drives before a capture.
- Using a striped RAID array (RAID 0).
- Ensuring the hard disk is on its own PATA chain, or using a SATA drive.
- Turning off the capture preview function from within the video capture software.

Look sharp: a capture device such as this one from Pinnacle is vital for transferring video to PC.

■ Menalto's Gallery
<http://gallery.menalto.com>

Disc or drive? Setting up a one-click video gallery

So, you've managed to copy your VHS tape to hard disk. The next step is to burn the footage to DVD using an authoring application. Not only do they copy the files to a DVD format readable by a standalone DVD player, but they also allow you to edit the footage and add menus and themes. Turn to page 94 for a roundup of affordable DVD authoring applications.

Alternatively, if you have a huge number of videos you'd like to have easy one-click access to, you can load them onto your hard drive as a video

gallery. There are many free applications on the Web that can catalogue your media collection. Some of these apps are specifically designed to handle images in online photo galleries, but the majority can also be used (or modified) to list and launch all of your videos.

One of the most popular Web applications for the job is Menalto's Gallery. To run it, you'll need to install a Web server (such as Apache or IIS) along with PHP and ImageMagick. Menalto's Gallery is preconfigured to

accept a number of video formats including AVI, MPEG and WMV, but it's simple to add support for more formats via the configuration pages.

Adding media is as simple as copying the files to a location on the hard drive that is accessible from within Gallery, selecting the Upload Photos admin option followed by the URL tab, and specifying the directory you copied your videos to. From then on, playing the footage is straightforward. Simply locate the relevant file in the gallery and click on it.

Get into Production.....

with the latest affordable 9 target DVD/CD duplication tower

Capax has a complete range of duplication equipments and accessories, catering for home user to desktop publishers; to corporate production/backup systems; right up to continuous mass production lines. Choose from our manual 3, 5, 7 or 9 target towers.

DVD burners speed or space?

DVD aficionados now have a choice between maximum speed or high capacity, or even a combination of both. Nick Race reviews a selection of multiformat drives.

BenQ DW1600

Although BenQ recently discontinued this model, it's one of the rare 16x burners on the market and stock should be available for at least the next few months. The firmware has been updated since the first release (reviewed APC August, page 45), it's a preview of the speeds you'll see when 16x drives arrive in larger numbers.

A full DVD+R writes in six minutes and five seconds, averaging 11.36x over the 4.7G disc. Reading the disc takes nine minutes and 35 seconds at an average speed of 6.24x. CD-R writing takes two minutes and 53 seconds.

Double Layer burning takes 44 minutes and 51 seconds at an average of 2.39x to fill the 8.5GB disc. For DVD-R support, look out for BenQ's DW1620 and DW1610 (Double and single layer drives, respectively), which will replace the DW1600 later this year.

Price	\$239
✓	Fast DVD+R burning.
✗	No DVD-R support.
Verdict	★★★★☆

Iomega Super DVD

If burning large files isn't an issue, you might want to settle for a single layer-only drive. This Iomega unit supports DVD+R at 12x, DVD-R at 8x, and writes to DVD±RW discs at 4x.

The drive writes a full DVD+R in six minutes and 48 seconds, averaging 10.17x over the length of the disc.

Reading a burned disc takes six minutes and eight seconds at an average of 9.79x.

CD-R burn speed is a quick 48x, with CD rewriting at 24x. It takes three minutes and 37 seconds to write a full 650MB CD-R at an average of 25.28x.

The outstanding software bundle includes Iomega's DVD Wizard, Hot Burn Pro, Iomega Automatic Backup, MusicMatch Jukebox, Sonic MyDVD, Sonic CinePlayer and Adobe Photoshop Album 2.0 Starter Edition.

✓	Excellent CD and DVD burning speeds; strong software package.
✗	No Double Layer writing.
Verdict	★★★★☆

LG GSA-4120B

The drive for almost every situation, this LG supports DVD+R at 12x, DVD-R at 8x, DVD rewriting at 4x and DVD+R Double Layer at 2.4x. DVD-RAM is supported at a maximum speed of 5x in Z-CLV mode, the only player in the roundup to support this format.

Performance isn't fantastic, though this might not be an issue if compatibility is your main priority. In testing, a recording time of seven minutes and 49 seconds was recorded, averaging 7.67x over

the length of a disc. Reading back the burned DVD takes four minutes and 53 seconds, one of the better results in these tests.

CD write speed is 40x and rewriting is rated at 24x. In testing, the LG takes three minutes and 57 seconds to complete a 650MB disc.

The GSA-4120B makes up for its lack of burning power with an impressive software bundle. CyberLink Power2Go and PowerProducer Gold, Nero Express 6 and InCD from Ahead are all included with the drive.

✓	DVD-RAM support; great software bundle.
✗	Slow DVD writing.
Verdict	★★★★☆

Lite-On SOHW-832S

Support for large capacity 8.5GB discs in addition to fast single layer speeds make this drive stand out. DVD+R Double Layer writing is rated at the ubiquitous 2.4x speed, burning a disc in 45 minutes and 15 seconds at an average of 2.36x over the length of the disc.

Despite being only rated for 8x, writing a single layer DVD+R disc to capacity takes nine minutes and five seconds at an average of 7.4x.

A burned DVD reads in six minutes and 21 seconds, at an average of 9.25x.

This drive burns to single layer DVD+R and -R discs at both 8x and 4x for rewriting. The drive performs CD writing and rewriting at 40x and 24x respectively. The test disc writes in three minutes and 36 seconds.

This is another DVD drive that comes bundled with an excellent suite of software consisting of CyberLink Power2Go 5 and an OEM version of Nero 6, comprising InCD 4, NeroVision Express 2 and BackItUp.

✓	Excellent DVD and CD writing speeds; strong software package.
✗	Relatively slow DL burning.
Verdict	★★★★☆

OptoRite DD1203

12x SL

Tests with this burner show how important choosing the right disc type can be. Like the DD1205 (see right), the DD1203 has problems achieving high speeds with poor media. In addition to 12x DVD+R discs, this drive is rated at 8x for writing DVD-R discs and 4x for rewriting both formats.

The drive writes a DVD+R in eight minutes and two seconds at an average of 7.83x over the length of the disc. Reading a burned disc takes 14 minutes at an average of 4.04x — an extremely poor result. Performance didn't improve with different media.

Price \$196.90

✓ Good CD performance.
 ✗ Poor DVD write performance; media compatibility.

Verdict ★★★★★

CD performance is very good with quality discs. The burner is rated at 40x for CD writing and 24x rewriting, and in tests the DD1203 manages to write a full CD-R in three minutes and 13 seconds.

The OptoRite drive comes with a solid software package consisting of Nero Express 6.3 OEM Edition, PowerDVD 5 and Sonic MyDVD 5.2.

OptoRite DD1205

12x DL

Not only do you get large file capacity with this drive, but Double Layer speeds are super-fast. The drive fills the 8.5GB DVD+R disc in 42 minutes and 56 seconds, averaging an above par 2.43x. Both OptoRite drives here refuse to burn at high speed rates on generic media, though this unit shines with quality discs.

In addition to 8.5GB discs, the drive writes to DVD+R at 12x, DVD-R at 8x and rewrites DVD±RW at 4x. For single layer burns,

Price \$218.90

✓ Great DVD+R DL performance; good CD performance.

✗ Media compatibility.

Verdict ★★★★★

this drive takes seven minutes and 12 seconds at an average of 8.16x over the length of the DVD+R disc. With upgraded firmware, disc reads take six minutes and five seconds, well and truly beating the DD1203. CD support extends to 40x for writing and 24x for rewriting, writing a disc in three minutes and 12 seconds in tests.

The drive comes with the same software as the DD1203: Nero Express 6.3 OEM, PowerDVD 5 and Sonic MyDVD 5.2.

Plextor PX712-A

12x SL

Plextor has long been known as a purveyor of high-quality optical drives with stunning DVD performance. The PX712-A is no exception. It burns DVD+R at 12x, DVD-R at 8x, and rewrites both formats at 4x.

The PX712-A records a complete 4.7GB DVD in six minutes and 23 seconds at an average of 10.27x. Nero CD-DVD shows the drive reaches its maximum 12x recording early in the burn process, meaning the drive doesn't struggle to perform at high bit rate

Price \$396

✓ DVD write speed; excellent software.

✗ Slow CD writing; no Double Layer writing.

Verdict ★★★★★

burning. Oddly, the drive takes longer to read back the burned DVD — six minutes and 37 seconds at an average speed of 9.05x.

The drive is rated for CD writing at 48x and rewriting at 24x, though the PX712-A doesn't reach its maximum potential in testing. It takes four minutes and 13 seconds to complete a full 650MB CD.

Software is excellent: Nero Express 6, InCD4, BackItUp, PowerDVD 5, Power Producer 2 and PlexTools Professional.

Sony DRU-700A

8x DL

This is APC's second look at this Sony drive (see APC August, page 45). Double Layer performance is respectable, filling the 8.5GB disc in 45 minutes and 10 seconds at a rate of 2.36x.

The DRU-700A supports 8x burning of both DVD+R and -R media, as well as rewriting at 4x for both disc types. However, the drive is the slowest of those tested here at burning single layer media, taking nine minutes and 18 seconds to burn an 8x DVD+R, equating to an average of 7.17x over the length of the disc.

Details

Contact Sony
Phone 1300 138 249
Online www.sony.com.au
Price \$299

✓ Great CD performance.

✗ Slower DVD performance.

Verdict ★★★★★

DVD reading results come in at nine minutes and 13 seconds, or an average speed of 6.15x over the length of the disc.

CD media burns at a top rate of 40x and CD-RW discs at a maximum of 24x. Reading a burned disc takes two minutes and 40 seconds.

The drive's bundled software consists of Nero Burning Rom 6 SE, NeroVision Express 2, BackItUp and Showtime, all from Ahead's software stable.

How we tested

All drives were tested on an Intel Pentium 4 3GHz (Northwood) PC with 512MB of DDR400 RAM in an iOpen XC Cube AV Edition Small Form Factor PC. Drive speeds and reliability were tested with Ahead

Nero's CD-DVD Speed tool version 3.12. DVD+R speed tests were performed using Verbatim and TDK DVD+R discs.

CD tests were performed with Kodak 183-7194 74 minute high-quality gold

master discs, Sony 80 minute CD-Rs and low-quality 80 minute generic discs for reliability. Double Layer testing was performed with Philips and Verbatim 2.4x rated DVD+R DL media.

Burn Hollywood, burn

These packages not only burn your movies to DVD, but also allow you to edit and add menus. **Nick Race** dons his director's cap.

How we tested

Comparative testing was performed with six clips in MPEG-1, raw AVI, QuickTime (linear transcoding) and DivX 3 and DivX 5 files. Clips varied between five and 15 minutes long. All software was patched to the latest versions before testing.

A burner comes with basic DVD tools, but there are many authoring packages available which enable the amateur auteur to enhance their home movies with a range of professional effects.

Much has changed since APC's last roundup of DVD authoring software (June 2003, page 76), especially at the lower end of the market. This is excellent news for those who don't want to fork out more than \$1,000 for a professional authoring package. The software bundles reviewed here all retail for less than \$200 and offer a degree of

functionality similar to that found in higher end products reviewed less than 18 months ago.

Features have also improved markedly since then, with more refined menu creation, video editing functions and lots of themes to suit any DVD. The main criteria for evaluating these packages are the ease of use, solid and useful editing tools and wide support for different video codecs. Bonus points are awarded for software that can create logical cascading menu systems and the ability to create chapters from existing long video files. None of the packages here support Double Layer DVD authoring.

Online	www.comm-unique.com.au
Price	\$199 (part of Nero 6)
✓	Excellent effects; good preview mode.
✗	No overview of DVD project.
Verdict	★★★★☆

Ahead NeroVision Express

Part of Ahead's excellent Nero 6 package, NeroVision Express is an added extra enabling the user to edit, transcode and author video and DVDs. It's a basic program, but it gets the job done through quick previews and a good mix of effects.

The application is laid out in a wizard-style series of pages, each offering a different function, though lacks an overall project view. You can import MPEG, QuickTime, DivX and raw AVI files, and effects, transitions and text overlays can be added, though no proper timeline mode is available. Effects extend far beyond the usual wipes and fades.

Chapter creation is best done manually by watching the footage and adding chapters as

required. An automatic chaptering mode is available, but the results are poor.

Automatic sub-menu creation when a chaptered clip is added to the main menu is a nice touch. As with a retail DVD, the sub-menu containing the chapter marks and thumbnails are created and added automatically.

You can add background animations and audio to menus as well as sub-menus. The only downside is that you need to download a 22MB file if you want menu templates.

Ahead are to be commended for creating the fastest and smoothest preview mode. Clips load very quickly and the onscreen controls are equally quick to respond. Transcoding is reasonably speedy and burning to disc is simple.

Contact	Apple
Phone	13 36 22
Online	www.apple.com.au
Price	\$79 (part of iLife suite) or free with new Mac systems
✓	DVD tree structure; excellent templates.
✗	Support for QuickTime footage only.
Verdict	★★★★☆

Apple iDVD

Bundled as part of the iLife suite, iDVD is the authoring side of Apple's iMovie editing application. As iLife is targeted at beginners, iMovie and iDVD don't offer the flexibility of the other software in this roundup. Both iMovie and iDVD are considered together here.

The major complaint with iDVD is that only QuickTime (MOV) files created as linear video tracks can be imported directly into iDVD. There's no support for other popular digital video formats such as AVI (common in digital still and video cameras), MPEG or DivX. There is a workaround — import your AVI and DivX files into iMovie and exporting them as QuickTime — though this doesn't help if you want to use MPEG.

That said, iMovie supports both storyboard

and timeline editing modes and a good range of effects and colour transformations. The software doesn't offer any support for automatic chapter creation, so the footage must be scanned through manually or replayed in real time to set appropriate chapter points.

Once film is edited and chaptered in iMovie, a button lets you import your working files into iDVD for creating the menu. You'll find the best range of menu templates among any of the applications reviewed here.

The other strong point of iDVD is the tree structure view which appears once files have been added to the DVD project, making it easier to navigate. A preview mode lets you test the DVD menu before using the built-in burning engine.

InterVideo WinDVD Creator Platinum 2

With support for devices connected by USB, FireWire or card readers, getting your video into WinDVD Creator 2 is a breeze. It's also easy to edit, with a basic storyboard preview window, letting you check before choosing a clip.

A timeline mode offers more control and facilitates the addition of audio files and text overlays, as well as a large number of transition effects. Transitions are demonstrated in the preview window, making choosing the right look even easier.

Video overlays are available via a right-click menu containing a number of video effects such as emboss, brightening and colour manipulation, though advanced effects such as lens flares are

missing. You can also add text overlays with different fade in and out effects and fonts.

Menu creation is a little too basic, with the templates only including Play and Chapters buttons for the main DVD menu. Chapter points are automatically created at the end of each clip in the project; however, the option to create multiple chapter points in longer clips is not provided.

The preview mode takes longer than the other software tested and isn't stable, crashing unexpectedly several times during testing. Final transcoding of the DVD into the end product is also a slow process. WinDVD Creator 2 is able to burn discs directly to DVD, or save the file structure on the hard disk for later.

Details

Contact	InterVideo
Online	www.intervideo.com
Price	US\$99.95
✓	Easy to use.
✗	Slow to encode video files; preview mode buggy; basic chapter function.
Verdict	★★★★☆

Roxio DVD Builder

The installation and software updates can take a considerable time, but Roxio DVD Builder is nevertheless one of the more user-friendly applications here. That's because all the work is done in a single screen, giving you a good idea of the DVD project as a whole.

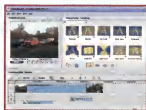

The software supports a wide range of video files, including MPEG, AVI and QuickTime. Support for DivX is somewhat haphazard, though — you can't use files encoded in DivX 3, but DivX 5 files can be imported.

Once video files have been loaded, editing can be done in storyboard mode. Alternatively, an "Advanced Edit" function is available with a timeline approach. The timeline editing mode shows all relevant information such as existing

audio tracks for videos, video effects, transitions and dubbed audio tracks.

Video effects include all the basics, such as colour changes, sound overlays and many transitions. There are also a number of more advanced techniques, like lens flares, swirls, tiles and video shaping. Text overlays allow you to add credits. Chapters can be created either manually or automatically, but the results in automatic mode are more miss than hit. However, sensitivity can be adjusted.

Once the video has been edited, creating a menu is as simple as dragging the clip on to the preview window and renaming the menu options. DVD Builder also supports animated backgrounds, animated thumbnails, menu audio and themes.

Details

Contact	Roxio
Online	www.roxio.com.au
Price	\$99.95 (part of Roxio Creator 7 suite)
✓	Good editing mode; excellent range of effects and transitions.
✗	No support for non-chapter sub-menus.
Verdict	★★★★☆

Ulead DVD Movie Factory 3

Simple and effective editing functions and menu creation make Ulead's DVD Movie Factory 3 one of the better entry-level authoring applications currently on the market.

Basic timeline and storyboard video editing functions are built in, letting you select and trim segments from files as desired. The usual array of transition effects, text overlays and video effects is also included.

Chapters for the DVD can be added manually in real time or automatically. However, the automatic mode is next to useless with shorter clips, since the sensitivity of the automatic chaptering cannot be adjusted (unlike Roxio DVD Builder). As a result, a five-minute video clip ends up with the maximum 99 chapters.

A huge number of preset templates makes menu creation simple and effective. A nice touch is the program's ability to skip through the clip and choose a frame to be used as the thumbnail for the menu. This makes a lot more sense than using the first frame, as clips often begin with black fade-ins or other effects that don't describe the contents of the clip.

Movie Factory 3 doesn't support background clips for the menu, though thumbnails can be animated as a teaser.

Once authoring is complete, a testing mode lets you explore the DVD menu and ensure all clips are present and correct. Rendering of the MPEG-2 files for the final DVD is done once the option to burn the DVD is selected.

Your free DVD+R

There's no such thing as free these days — except on the cover of APC, thanks to this month's joint promotion.

LASER

The free DVD+R on the cover of the magazine is brought to you by LASER, the multimedia and computer accessories brand of import and wholesale company NaSa Multimedia Technology.

The LASER brand has been present in the Australian retail market since the late 1980s. Focused on developing partnerships with Australia's leading retailers, LASER has developed a range of computer accessories for the average consumer that are comparable with, and in some cases better than, those available from the leading brands in the industry.

While LASER is one of the leading suppliers of DVD and CD media in Australia, this is only a minor part of its overall product range. In addition to media it also offers customers a wide variety of product choice in the following categories:

- **Hardware:** mobile HDD racks, external cases and KVM switches.
- **Computer accessories:** CD/DVD storage, internal USB cards, external hubs, keyboards, mice, speakers and media labelling accessories.
- **Laptop accessories:** executive and backpack-style cases, multipurpose locks and desktop stands.
- **Blank Media:** CD-R/W and DVD±R/RW.
- **Cables:** network, USB and PS/2.

APC and NaSa Multimedia Technology bring you a DVD+R in a joint promotion to mark the DVD's extraordinary impact on computing. Not only can you now store an entire videotape on one DVD, but for the first time, a real alternative exists to traditional computer backup systems.

WHY DVD+R?

There are two popular write-once formats, DVD+R and DVD-R. We've selected DVD+R because its technical features make it a better proposition for computer usage than DVD-R. However, DVD+R is just one of many recordable formats, and this variety is likely to befuddle some users. To help counter this potential confusion, the table below allows for direct comparison of these formats.

COMPATIBILITY

The majority of standalone DVD players support the DVD-R/RW format. The DVD Forum Web site, at www.dvdforum.org/forum.shtml has a list of compatible players.

While not as compatible across standalone DVD drives as DVD-R, most drives sold for PCs today support DVD+R. DVD+R/RW is the format of choice for the big PC vendors.

DVD-RAM is the least compatible of all formats, relying on a cartridge and caddy system. It cannot be used in most standalone DVD players or drives. However, the discs in Version 2 (see table) cartridges can be removed and played in some PC drives or standalone recorders without the caddy mechanisms.

SPEEDS SUPPORTED

- DVD-R: up to 16x.
- DVD-RW: up to 4x (faster speeds in future).
- DVD+R: up to 16x.
- DVD+R DL (Double Layer): up to 4x.
- DVD+RW up to 8x (faster speeds in future, eventually up to 16x).

PROS AND CONS

DVD-R/RW is the ideal format for creating and watching home movies as it can play on the largest number of standalone DVD players. It can also be used for computer data, but is not as strong as DVD+R/RW in this regard.

Newer drives have technical features that make DVD+R/RW better for computer data, such as random read/write and defect management. Crucially, the DVD+R/RW format supports multisection: you can write to part of the disc, then come back to burn more data later. It also supports lossless linking for easier editing of disc contents.

DVD-RAM is widely regarded as the best format for computer data. It can be rewritten up to 100,000 times, making it the most hard disk-like of all the formats, and has random read/write, defect management. Some camcorders can record directly onto the disc, which makes editing easier. The format offers a powerful backup solution to replace older backup hardware. **EDIT**

Type	Details	Discs and sizes supported
DVD-R/RW	DVD-R is write once, DVD-RW is rewritable. DVD-R are the most compatible formats for standalone DVD players (ideal for distributing home movies). DVD-RW can be rewritten up to 1,000 times in ideal conditions. Supported by the DVD Forum, which includes companies such as Pioneer and Apple. The Apple SuperDrive is a DVD-R/RW drive.	DVD-5 (4.7GB): Single sided, single layered. These discs come in two main types: DVD-R for general use and DVD-R for archiving and professional use. DVD-18 (9.4GB): Double sided, single layered. There are plans for DVD-R/RW Double Layer drives.
DVD+R/RW	DVD+R is write once, DVD+RW is rewritable. DVD+R/RW was formulated to be more compatible across computer drives, hence it has technical features that make it better for storing computer data. DVD+RW can be rewritten up to 1,000 times. The DVD+R/RW format is supported by the DVD Alliance (www.dvdalliance.com) which includes Philips and Sony and most of the major computer companies such as Dell, HP and Microsoft.	DVD-5 (4.7GB): Single sided, single layered. DVD-9 (8.5GB): Single sided, double layered. DVD-18 (17.0GB): Double sided, double layered. Unlike DVD-R/RW, DVD+R/RW can be written in multiple layers, hence the format's larger capacities.
DVD-RAM	DVD-RAM was the first rewritable format and was created primarily for computer data and applications, although it's just as good at storing movies (Panasonic's DVD recorders use it). Unlike the other formats, it can be rewritten up to 100,000 times, so it's a true alternative to traditional magnetooptical backup drives.	Version 1: 2.6GB or 4.7GB for single sided discs. Version 2: 5.2GB or 9.4GB for double sided discs.

Internet calling war heats up

Internode will allow customers to make phone calls over home DSL services from early next year, but smaller players are already doing it, writes *Dan Warne*.

Internode is claiming that its Voice over IP (VoIP) pricing is set to "demolish the traditional telco charging model" from early next year. According to the ISP's CEO, Simon Hackett, "Increasingly, we will drop the [long] distance tax out of the voice call."

Internode is currently in the final stages of long-term testing. "With voice, customers have the expectation of dial tone reliability and that's what we plan to deliver," he said.

VoIP services have been available to Australians through US service providers for some time. But using them is similar to talking on a satellite phone: the trans-Pacific round trip for the data adds a minimum of 70ms delay, which is enough to provide noticeable "echo". With normal Internet latencies, it's more like 600ms, which is a little over half a second's delay. Internode will use its existing national broadband network to carry the VoIP calls with no delay.

One company, OzVoip (www.ozvoip.com.au), is already marketing VoIP hardware and services to Australian broadband users regardless of their ISP. It resells the services of two companies: MiVoice and ATP, which both offer Direct Inward Dialling — a local telephone number in a major

Shout about it: VoIP means low-cost calls for Internet users.

capital city of your choice that redirects through to your IP phone or PC SIP-phone software.

Competitive call rates are being offered: MiVoice has nationwide flat rate calls for 10 cents per minute, while ATP charges 15.4 cents for the first 10 minutes and 5.5 cents per minute after that, not to mention unlimited free local calls to other ATP customers.

As always with new technology, as more major players enter the VoIP bunfight we can expect these rates to drop even further.

More exchanges to get DSL

Telstra has announced it will enable 99 more telephone exchanges for broadband, providing the service to 150 towns.

It's the result of the Federal Government's new Higher Bandwidth Incentive Scheme (HIBIS), which gives incentives to telcos to install broadband in regional areas.

Telstra is using the money to reduce the number of people that need to sign on to the company's broadband demand register before an exchange can be enabled. The threshold in some areas is now as low as 35 people.

Find out more about the HIBIS at www.apcmag.com/info/hibis. Telstra's demand register can be found at www.telstra.com.au/demand.

Your monthly guide to the best deals

APC is proud to partner with the independent broadband monitoring service Broadband Choice (<http://broadbandchoice.com.au>) to bring you the best broadband deals every month.

The comparison table on the following page focuses on ISPs that best serve the majority of APC readers' needs. These include coverage in Melbourne, Brisbane and Sydney; 1300, 13 or 1800 telephone support; contracts of 12 months or less; and five or more email addresses.

We've excluded ISPs that meter both uploads and downloads and only listed those that meet at least three of our four plan selection criteria:

- Budget plan: cheapest deal under \$30.
- Light plan: cheapest deal under \$65, with at least 512Kbit/s speed and 1GB data.
- Family plan: largest download allowance under \$90, at least 512Kbit/s and 5GB data.
- High speed: cheapest 1.5Mbit/s plan under \$160, with 4GB data minimum.

If an ISP has "unlimited downloads" but speed is throttled after reaching a certain limit, the portion in which you can get full-speed downloads is listed as their limit.

We've picked the lowest price for a contract period of six months or less for broadband installation. Otherwise, the lowest priced option was selected. The installation price doesn't include a modem because you'll generally get better value buying a modem separately. See www.apcmag.com/web/_0/Get Routed! for advice on choosing a modem/router.

Can't find your provider in our list? That's because some of the largest ISPs, and many smaller ones, didn't meet our selection criteria.

ISPs enter their own information into the Broadband Choice database. ISPs can contact bc@whirlpool.net.au for more details.

Data was extracted from the BroadbandChoice database on 28 July 2004.

Netgear's new modem DSL2+ capable

Netgear (www.netgear.com.au) has released a new ADSL modem router, the \$159 DG632, which has hardware support for the forthcoming DSL2+ standard. Netgear says that once the new 24Mbit/s standard is ratified in Australia, it will release a firmware update. Not all modems can be upgraded to DSL2+ compatibility because of the need for a faster internal processor.

However, the DG632 only comes with one Ethernet port and one USB port — if you want to connect multiple PCs you'll need to buy a network switch or wireless access point as well.

\$0 BROADBAND INSTALLATION¹

Don't wait any longer for faster Internet. Get into it now, with \$0 OptusNet Broadband installation¹. Then you can spread your wings with:

- ✓ Lightning-fast download speeds to make your movies, music, shopping and games really fly.
- ✓ Flat monthly broadband rate with no excess usage charges - we simply apply a speed limit².
- ✓ 24/7 technical support at your beck and call.

To find out more, call 1800 200 808 Monday - Saturday or visit www.optus.com.au/optusadsl or your local Optus World store.

**Hurry! \$0 installation
offer ends 5 October 2004.
SO TAKE OFF NOW!**

Just say the word **'yes'**
OPTUS

Terms and Conditions: ¹Offer valid only for new residential customers who sign up to OptusNet Broadband for 12 months between 4 September 2004 and 5 October 2004 (unless withdrawn earlier) on a broadband and home phone (local and long distance) 'yes' rewards package. Not available with any other promotional offer. DSL \$0 self-installation will be applied as either a price reduction or a credit at Optus discretion. \$149 saving includes a new DSL modem. The DSL modem is not exchangeable for cash. To receive the \$0 Cable installation, you must pay by direct debit. Optus must receive a valid direct debit application form within 6 weeks of installation. A \$20 direct debit rebate will then be applied. Optus reserves the right to quote for non-standard installation. Optus services advertised are available in metropolitan and many regional areas of NSW, ACT, VIC, QLD, SA & WA. For technical or commercial reasons, not all homes can be connected to all Optus services and technology will depend on customer's location. ²Exceeding monthly Data Allowance will see your speed limited to between 20kbps and 28kbps until the first day of the next billing month. Unused Data Allowance cannot be rolled into subsequent months. Use of the service is subject to the Customer Terms and Acceptable Use Policy. \$200 pro rata early disconnection fee applies. **General:** A \$79 pro rata disconnection fee applies to Optus Local Telephony and/or pre-selected Long Distance if disconnected within 12 months. Full terms and conditions apply, see www.optus.com.au/optusnet for details. Not available with any other promotional offer. All information correct as at 4 September 2004. Prices subject to change without notice. 'yes' rewards Terms and Conditions apply. SingTel Optus Pty Limited trading as Optus Communications, 11 Miller Street 10th Sydney 2000. Optus, the Optus logo, and 'yes' logos are trademarks of SingTel Optus Pty Limited. Optus Communications services are provided by Optus Networks Pty Ltd ABN 92 008 570 330. OPT371092

available in more homes than ever before.

WORKSHOP

Hands-on with hardware and software, plus bonus CD content

Bonus CD software

Most Workshop articles are accompanied by bonus software loaded onto our cover CD. Just look for this icon — the software it identifies is often integral to the article. The selection ranges from full-working versions and trial versions to shareware and freeware.

APC cannot provide tech support for these programs, but if you have a problem with the CD itself, by all means holler our way (see page 8 for details on how to contact our CD team).

Site of the month

www.cdfreaks.com

CD Freaks is dedicated to all things related to optical storage, whether they be CD or DVD, media or drives. It plays host to the usual array of news stories, articles and reviews that you'd expect of such a site.

But what makes CD Freaks worthy of inclusion among your bookmarks is its update tracker, which shows a list of recently updated firmware and software. Each version has its own page where users can submit their "reactions" to the update, an invaluable resource for anyone who prefers to err on the side of caution before installing something that could ruin their hardware.

104 Windows XP Secure install

A clean install is a good way to refresh a cluttered Windows XP PC, but essential security precautions need to be taken first. *Mathew Dickerson* safeguards your system from Internet nasties.

108 Windows/Linux Multi-booting

Having trouble deciding whether to install Linux or Windows? *Eric Wilson* and *Jarrod Spiga* explain how, with a little ingenuity, you can run both simultaneously.

110 Linux Email server, part 1

Setting up your own email server in Linux can be a rewarding challenge, as *Anton Tomazin* and *Caroline Leming* explain.

113 Windows Remote assistance

James Bannan demonstrates how to obtain or give help online using Windows XP's Remote Assistance tool.

114 Internet Apache Web Server, part 4

There are times when you'll want to only allow authorised users to access content on your server. *Jarrod Spiga* explains how to restrict access to sections of the Apache Web Server.

117 Windows Virus identification

A virus attack on a Windows PC needn't be a total disaster. *James Bannan* details how to recover from such a situation.

118 Linux Debian, part 4

Andrew Lau and *Jarrod Spiga* introduce the BASH shell and explain how to write scripts to take control of your system.

120 Software MP3 DJ mixing

Having evolved from disc jockey to digital jockey, the new generation of DJs is spinning hard disks, not vinyl. *Daniel Winter* explains how you can do it too.

122 Hardware Water-cooling

The basic principles of water-cooling are simple, but the installation details vary for each system. *James Rolfe* takes you through the installation of a typical water-cooling kit.

124 Handhelds Wi-Fi

Anthony Caruana guides you through the process of getting your Pocket PC wirelessly connected to the Web.

All code fragments and examples given in Workshop articles are for demonstrative purposes only. Questions or comments? Email workshop@opcmag.com.

Worry-free clean installation

A clean install is a good way to refresh a cluttered Windows XP PC, but essential security precautions need to be taken first.

Mathew Dickerson safeguards your system from Internet nasties.

Bonus CD software

QChain.exe

Skill level

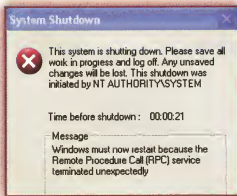

Intermediate

Requirements

Windows XP CD and product key • backup media • Internet access (broadband recommended).

Time to complete

10 hours (2 hours for the secure Windows install)

Two minutes of damage: a Blaster infection, Instant Messenger spam and an Internet Explorer crash can all occur before critical updates are installed.

How long can an unpatched installation of Windows XP survive once exposed to the Internet? To answer this question, a clean installation of Windows XP Home was put on a test system without service packs, patches or virus scanners. After making an image of the installation (so the same clean installation could be reinstated for each test), the system was exposed to the Internet via ADSL, cable and dialup modem.

In all cases, the system was infected with a worm or virus within two minutes — before any security updates could be downloaded, let alone a browser window opened up. In the worst case, the test PC rebooted within 30 seconds of being connected to the Internet after being infected with a Blaster variant.

A variety of attacks were made, ranging from Instant Messenger service pop-ups to a variety of worms and Trojans showing their ugly symptoms, including shutting down the system. If the PC could be used long enough to visit Web sites, various spyware was installed and pop-ups ads would start to appear. Annoying errors occurred in Internet Explorer and software to help eliminate pornography from the hard drive was automatically installed.

Just as disturbing was the volume of traffic generated by unfriendly software. In the worst example, 16,516 packets of data were sent within two minutes of the PC being connected.

LOOKING FOR A SOLUTION

So how do you perform a secure installation of Windows XP? The catch-22 is that you need to connect to the Net to download your updates and virus definitions, but the very act of connecting is enough to infect your PC. Should you avoid infection for long enough to access the Windows Update site, you'll need to download 53 critical updates.

However, steps can be taken to fully patch and protect your machine before it's exposed to the outside world. The best method is to be completely prepared before an installation. If you can't make those arrangements, there are alternatives that will result in a good chance of an infection-free installation.

BACKING UP YOUR DATA

Everyone wants their PC to perform as well as it did when it was new. Over time, though, a hard drive becomes cluttered with additional files and slows down. A clean install of Windows will make you feel like you just went out and bought a new PC.

Obviously, data needs to be backed up before you wipe an installation. You should already be backing up your essential data on a regular basis (and storing it off-site) in case of an emergency. But when you wipe the hard drive, you'll also have to back up any other data that you want to transfer to your fresh Windows installation.

Windows XP has a handy utility called the Files and Settings Transfer Wizard (F&STW). It's designed to be a comprehensive, all-in-one utility that backs up all your data, plus your personalised settings, re-creating a Windows environment just the way you like it.

All programs must still be reinstalled on the new computer. Actual programs aren't migrated by the F&STW and it's a good idea to install your programs before you run the wizard on the new installation so that the settings are transferred.

The first step in backing up before using a wizard like this is to have the data organised in a logical fashion. It doesn't have to conform to any specific rules, it just needs to make sense. With all data concentrated in a few specific user areas, the job of backing up and restoring is much easier.

Once the location of all the data is identified, run the wizard and indicate that you're backing up from the old computer. The F&STW can be run on any non-server based Windows operating system to back up data. However, it must be restored on a Windows XP Home or Professional system.

The next step is to select the method of transferring data. It's best to use removable media because it's relatively quick and allows you to store settings on a physical device outside the system, minimising the risk of accidental deletion when it comes time to reformat.

MEDIA MANAGEMENT

If you have a large quantity of data that will be cumbersome to copy to CD, it may be worth investing in a DVD burner. If that doesn't match your data storage requirements, consider an external USB hard drive — it's easy to connect and can affordably store huge amounts of data. USB flash drives are also a very quick and easy way to remove data from a PC.

Now select a custom list of files. Leaving all the default settings intact while adding the locations of your application data is recommended, but deselect the settings you don't want.

Then run the wizard — it creates a file or files containing all your settings and application data at the location you chose. This way you don't have to think about where the various settings for your installation are stored — the wizard works it out.

If you don't fully trust the wizard, copy the most crucial application(s) and data to CD as well — better to be safe than sorry. However, the wizard won't copy your passwords for certain things, such as your ISP details.

SAVING OS SETTINGS

Other items to be backed up manually include the password for your ISP, Windows Product Activation Key and the application used to load the video drivers. Create a list of usernames, passwords and product keys and store them securely on your PC.

If your copy of Windows is already activated and you plan to reinstall it on identical hardware, the following will save you any reactivation troubles.

■ Copy C:\Windows\System32\wpa.db to your backup location. Also put a copy onto a floppy disk, CD or some other form of removable storage media (it's only a couple of KB in size).

■ After the reinstallation of Windows, boot into safe mode by pressing F8 when Windows starts booting.

■ Copy the file from your backup to the C:\Windows\System32 directory on the new installation.

Be aware that if you try this on different hardware, you may still have to reactivate.

PREPARING FOR THE INSTALLATION

One of the advantages of preparing for a new installation is that everything can be downloaded and installed before connecting

to the Internet for the first time. This means your system can be fully immunised before that crucial first connection. You need to perform the following steps:

- 1 Visit the Windows Update Catalog Web site (<http://v4.windowsupdate.microsoft.com/catalog/en/default.asp>), which allows you to download the full copies of service packs and patches. Select the appropriate OS that you'll be installing on your system — even down to the service pack that comes pre-installed with your version of Windows. If in doubt, select Windows XP RTM (RTM stands for Release To Manufacture).
- 2 Download the latest version of QChain.exe from this month's cover CD.
- 3 Create a batch file to chain all of the patches together. The syntax of that batch file is:

```
@echo off
setlocal
set PATHTOFIXES=D:\QCHAIN
%PATHTOFIXES%\Q123456_x86.exe -z -q
...
%PATHTOFIXES%\qchain.exe
echo Qchain has finished applying
patches. Reboot your PC.
pause
```

Where D:\QCHAIN refers to the location where you will store all of the updates.

If any of these updates don't use Update.exe as the setup program, you may encounter difficulties in installing them via this script (visit <http://support.microsoft.com/default.aspx?kbid=262841> for more info). However, there's nothing stopping you from testing your batch file before reinstallation — applying a patch when it's already on the system won't do any harm.

The best thing about this procedure is that as new patches become available, they can be added to your QChain directory by including a new line to your batch file.

- Download the latest virus definition files for your preferred antivirus program. Ensure these files are kept separate so they can be burnt to CD.
- Have the motherboard CD on hand for driver files and INF files, but also take the opportunity to download the latest drivers for your hardware. These can be tested on your current installation.
- Burn all files to a CD-R/RW for installation.

OPTIONS FOR THE CORPORATE BOX

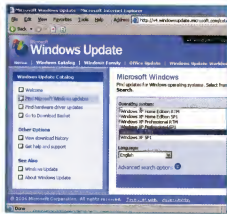

It's possible to create your own slipstream package (see "Creating a system image", APC May, page 130), but the process is cumbersome and clumsy for a single PC and it's hard to justify the amount of time required to create and test such an image. It's a different story if you need to roll out the same image to a number of machines.

You can also perform an unattended installation using an unattend.txt file, but again this is more relevant to a large rollout than a one-off installation. Refer to <http://support.microsoft.com/default.aspx?scid=kb;en-us;314459&Product=winxp> for more information.

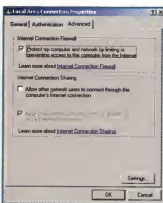

SECURING THE SYSTEM

The secret of any successful installation is good preparation, and the steps for the reinstallation are now relatively simple.

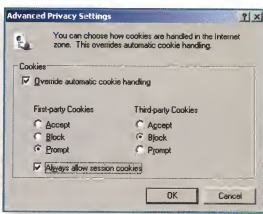

- Install Windows XP from the original CD. This takes 60 to 90 minutes, depending on your hardware. Ensure the system is not connected to the Internet during this process.
- Install SP1 from the pre-burnt CD and

1 Windows Catalog looks similar to Windows Update, but it allows you to download all patches for installation at a later time.

2 Make sure that your Internet connection firewall is enabled. The firewall under SP2 is much more secure and feature-rich than pre-SP2 versions of XP.

3 Change the cookie settings to protect your privacy. If in doubt, prompt — this gives you control on a site by site basis.

- Drive Image
www.powerquest.com/driveimage
- Scan PCs for viruses without having a virus program installed
http://housecall.trendmicro.com/housecall/start_corp.asp

- ▶ reboot. Run the qchain.bat file directly from CD and reboot once all patches are installed.
- Install your preferred antivirus package and update with the signature files on your CD.
- Ensure network card drivers are installed, either from the motherboard CD or the files you downloaded and copied beforehand. Install any other hardware drivers now.
- 2 Ensure the Windows Firewall is enabled, or install your own firewall software. Under Windows XP SP2, the Windows Firewall is enabled by default. However, under the Retail and SP1 installations, turn on the Internet Connection Firewall from under the Advanced properties of your network card. Use the default settings in the meantime.
- 3 Change your privacy settings to control cookies. Navigate to Start > Control Panel > Internet Options, choose one of the preset cookie-handling options. Better still, go to Advanced and Block All Third-party Cookies and Prompt for First-party Cookies.
- If you have additional software such as a security suite or spyware removal tools, install them now.
- 4 You should now have a fully patched and virus-protected system ready to connect to the Net. As a precautionary measure, set up your virus package to automatically update Virus Definition files on a daily basis and set up Automatic Updates in Windows to keep your system fully patched. Finally, activate Windows by copying the wpa.dbl file back into the system32 folder from within safe mode, by manually reactivating.

LACK OF PREPARATION

This installation is secure because all the required files have already been copied to CD. But sometimes you don't have that luxury. If your system is already infected by a virus and nothing seems to be working correctly, it's impossible to download all the necessary files before installation.

If you have no other PC or means of accessing the Net, here are a few basic principles to increase your chances of performing a secure installation. However, this method isn't guaranteed.

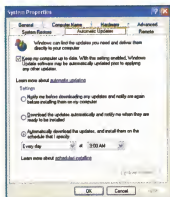

- Install Windows XP from your original CD. Ensure the PC is not connected to the Internet during installation.
 - Install an antivirus package.
 - Ensure network card drivers are installed.
 - Go to the Advanced properties of the network card and turn on the Internet Connection Firewall using default settings, as in the first example.
 - If you have a hardware Firewall or filtering on your router, ensure filtering is enabled.
 - Adjust the Privacy settings for cookie handling as described previously.
 - Install any additional security software, such as a third party firewall program, security suite or spyware blocker.
 - Connect to the Internet and go immediately to your preferred antivirus vendor's site to download and install the latest virus definition files.
 - 3 Go to the Windows Update site and start downloading service packs and patches.
 - As a precaution, run another virus scan to ensure the system is clean.
- Alternatively, consider using another PC to download the files you need.

RESTORE THE FORMER GLORY

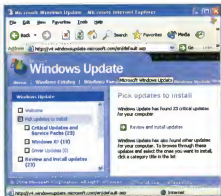

- 4 Now you're ready to reinstall the software and transfer files from your old configuration using the Files and Settings Transfer Wizard. Add printers, scanners and other hardware, and get your system up and running the way you like it.

Next, image your entire system. Popular applications used to perform this task include PowerQuest's Drive Image (www.powerquest.com/driveimage) and Symantec Ghost (www.symantec.com/sabu/ghost/ghost_personal). Both applications take a snapshot of the entire system, allowing future reinstalls up to this point to be achieved in minutes.

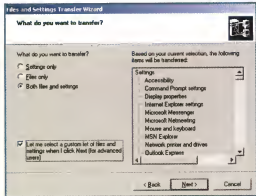

But if you want to remain security-conscious, the process doesn't finish here. You need to maintain the CD containing the system patches, as well as conducting a regular backup of all of your personal data, whether it's critical or not. [EITE](#)

- 4 Set Windows to automatically download and install security updates. This way, you won't have to remember to do it manually.

- 5 For a less secure install, go to Windows Update to install all Critical Updates as quickly as possible.

- 6 By selecting a custom list of files to back up, you can have a single archive containing your documents and settings.

LevelOne CamCon IP Network Camera

Gives live images from LAN or the Internet online and eliminates bulky coaxial cable as well as costly central control equipment. Because of pervasive of Internet and LAN, IP Network Camera is an affordable and self-contained device over the Internet.

WCS-2010 11g Wireless P/T Network Camera

- Complies with IEEE 802.11g standard
- Motorized Pan (270°) and Tilt (90°) via Web remote control
- High-quality CCD sensor integrated
- Supports UPnP
- Built-in omni-directional microphone
- Supports motion detection
- 16-channel monitoring software embedded

FCS-1010 10/100Mbps P/T IP Network Camera

- Supports 10/100 Mbps Ethernet with Auto-MDIX
- Motorized Pan (270°) and Tilt (90°) via Web remote control
- High-quality CCD sensor integrated
- Supports UPnP
- Built-in omni-directional microphone
- Supports motion detection
- 16-channel monitoring software embedded

WCS-2003 11g Wireless IP Network Camera

- Complies with IEEE 802.11g standard
- Supports MPEG-4 video streaming format
- Captures video by VGA CMOS sensor
- Supports time-stamp and motion detection
- Supports voice transferring and recording
- Supports DDNS for dynamic IP setting

<http://freshmeat.net/projects/lilo>
- LILO Mini-HOWTO
<http://tldp.org/HOWTO/LILO.html>

Bringing Linux into the fold can be a tricky task on a single PC. While there are plenty of reasons to switch to the open source alternative, a couple of things prevent you from doing so. At home, the kids rebel when they can't play their favourite games and at work, getting all your corporate apps running can be a nightmare. But that doesn't mean you can't have the best of both worlds.

Implementing Windows and Linux together can be trickier than housing multiple Windows installations. Different versions of Windows can mostly (but not always) read each other's disk partitions. On the other hand, Linux often uses a different file system, known as "ext3". There are also differences when it comes to swapping memory allocation — Windows stores all memory pages in swap files, whereas Linux uses more secure swap partitions. As a result, both operating systems need to reside on their own partitions.

WORKING WITH WINDOWS

If you're starting with a sole Windows installation on your system, it probably resides in a single partition that takes up all of your hard disk space. Adding Linux requires either a new hard disk, partitioning software, or a complete re-install of Windows.

Using a second hard disk is the most flexible solution. It allows you to keep each operating system on its own drive and also gives you the flexibility of removing a boot manager from the equation — the system's boot drive can always be modified in BIOS to switch to the other OS.

Disk partitioning software can be used to shrink the Windows partition in order to fit the Linux installation towards the rear of the disk. These tools aren't perfect though, and can create corrupt partition tables — ensure all data is backed up in case you have to re-install everything.

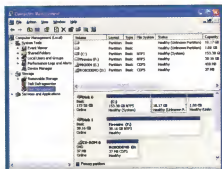

If you have Windows using multiple partitions on one or more drives, you may be able to make enough space for Linux by removing one or several partitions.

Installing Linux requires a few gigabytes of available disk space. The exact amount depends on the distribution and your packages, but a minimum of 4GB should be reserved.

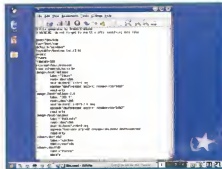

To view the configuration of your drives, select Start > Control Panel > Administrative Tools > Computer Management > Disk Management. Partitions may also be removed, created and formatted from this applet. Don't touch any partition labelled "Boot" or "System" — doing so could prevent Windows from loading. And never remove a partition unless all the data it contains is backed up.

Even if you've recovered enough space on your hard disk to install Linux, you could have difficulties booting to it. Older systems have trouble booting to partitions located after the 1,024th cylinder on a hard disk. Double-check your BIOS settings — if the hard disk is set up as a "Large" disk, or configured to use Logical Block Addressing (LBA), you're set. Otherwise, you'll need to rely on a boot floppy to access the Linux installation. Don't change the BIOS settings — doing so can trash the data on your drive.

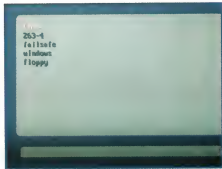

If you're starting with a blank slate, the order in which the operating systems are installed is crucial. Windows 95, 98 and Me put their own boot "manager" in the boot sector of the hard

1 View the configuration of your hard drives within Windows using Disk Management. Here, the last two partitions are primed for a Linux install.

2 To modify the entries in your Linux boot loader, load the config file (either `lilo.conf` or `grub.conf`) in a text editor and make the necessary changes.

3 Hitting Tab at the LILO prompt shows a list of all operating systems that can be run. Arrow down and select the one you want.

disk they're installed on. The term "manager" is used loosely because you aren't given the option to boot to any other OS — it forces you to boot to the Windows OS that was installed.

While other versions of Windows ship with friendlier boot managers, the best move is to load Windows first, then Linux.

BOOT CAMP

During the Linux setup, you'll be asked if you'd like to install the boot manager it uses (usually LILO or GRUB). Answer yes. You'll also be asked if you want to create a set of boot floppies. It's better to be safe than sorry, so answer yes again and have a couple of floppies ready.

Once you've booted into Linux, the first thing you should do is figure out which boot manager is running on your system. Enter the following at a command prompt:

```
dd if=/dev/hda bs=512 count=1
2>&1 | grep LILO
```

If **Binary file (standard input)** matches appears on the next line, you're running LILO. If you're taken straight back to a command prompt, enter:

```
dd if=/dev/hda bs=512 count=1
2>&1 | grep GRUB
```

If you get the desired response to the command, you're running GRUB. If both commands take you directly back to the command line, consult the documentation for your distro in order to determine what your boot manager is.

Both LILO and GRUB run based on the settings provided in a configuration file located in the `/etc` directory. LILO.conf contains the settings for LILO and grub.conf is the GRUB guide.

TAKE THE LILO ROAD

2 LILO is the most commonly used boot manager and is much simpler to use. The format of a typical lilo.conf file is:

```
boot = /dev/hda
delay = 10
vga = 0
image = /boot/vmlinuz
root = /dev/hda1
label = Linux
other = /dev/hda4
table = /dev/hda
```

```
label = WinXP
```

The top section defines LILO's global parameters and contains information about the disk, where it's located (`/dev/hda`) and how long it should wait before loading the default OS (`delay`).

The second section is loading a Linux OS. The image line refers to the filename of the kernel image that LILO will boot (`/boot/vmlinuz`). The first partition on the primary master disk (`/dev/hda1`) is listed as the root partition. Lastly, this OS has been given the friendly label of **Linux**.

The Windows entry is listed in the third section. Since it can't directly load the Windows kernel, LILO goes directly to the partition with the target OS (`/dev/hda4`). The friendly name for this entry is **WinXP**.

2 As soon as the system gets past the POST screen, you should see a LILO prompt. If you hit Tab, the list of operating systems defined in `lilo.conf` appears. It's then a simple matter of choosing the one you'd like to boot to.

THANKS FOR THE GRUB

GRUB is a more flexible boot manager and allows for the use of better looking menus. While being functionally identical to LILO, the configuration file is more complicated:

```
default=0
timeout=10
splashimage=(hd0,0)/grub/
splash.xpm.gz
title Red Hat Enterprise Linux ES
root (hd0,0)
kernel /vmlinuz-2.4.21-
15.0.3.EL ro root=/dev/hda3
initrd /initrd-2.4.21-
15.0.3.EL.img
title Windows XP
rootnoverify (hd0,2)
makeactive
```

As with LILO, the first section is devoted to the way GRUB runs. In this case, a 10 second timeout (`timeout=10`) applies and after this time passes, the zeroth OS loads (in this case, Red Hat Enterprise Linux ES). The `splashimage` statement allows you to define the look and feel of your boot menu.

GRUB also lists "friendly" names for each operating system, and can load Linux

kernels directly. The `root` statement identifies which partition the root file system resides on.

Note that the way in which drives are referred to is different under GRUB — the first number after `hd` refers to the drive number, while the second refers to the partition number. For instance, `hd0,0` is essentially the same as `/dev/hda1`.

For the loading of non-Linux operating systems, a couple of different commands are used. The `rootnoverify` statement sets GRUB's root device to the listed partition, indicating that this partition contains the OS that you'd like to boot to. The `makeactive` command sets the active flag on the partition so the system can boot to it.

GOING OS?

Both GRUB and LILO do a good job of booting to most operating systems. However, each boot manager has its own set of caveats and usage options that should also be considered when choosing the optimal booting solution. What's demonstrated here is just the beginning, and the boot loader is much like any other piece of software on your system — there are a number of ways to configure it to perform the task at hand. **ETC**

GRUB splash screens

GRUB boasts greater functionality when compared to LILO. One of the obvious differences is the splash screen that appears each time your system is booted.

This image can easily be replaced with one of your own — assuming you provide an image that GRUB is capable of handling.

Determine the resolution of your image and enter the following commands to convert it (assuming your image is an 800 x 600 image called "file.jpg"):

```
convert -size 800x600 file.jpg -
resize 640x480 -colors 15
-profile '*' file.xpm
gzip file.xpm
```

Then copy the resulting `xpm.gz` file to the `/boot/grub` directory and edit your `/etc/grub.conf` file. Now search for the `splashimage` line and modify the command as appropriate. If that line does not appear in your `grub.conf` file, add it below the `timeout` line as follows:

```
splashimage=(hd0,0)/grub/
file.xpm.gz
```

Setting up POP and SMTP servers

Setting up your own email server in Linux can be a rewarding challenge, as Anton Tomazin and Caroline Leming explain.

In this series . . .

Part 1 — October
Setting up POP and SMTP servers

Part 2 — November
Spam and virus protection

Part 3 — December
Webmail

Bonus CD software
sendmail.8.13.0.tar.gz •

Requirements

Root access on a Linux system • Net connection • Domain name and DNS configured • GNU m4 package installed.

Time to complete
2 hours (approx)

Email is something we all take for granted, but setting up your own server for this purpose can seem daunting. Even those who feel at ease tweaking labyrinthine code may hesitate when it comes to such a task. In the past, this hesitation was justified since it required the editing of cryptic configuration files. Today, a working email server is within easy reach of any intermediate Linux user.

This first instalment of a three-part series explains how to set up a basic email server using Sendmail as the Message Transfer Agent (MTA) and Dovecot for POP3 and IMAP.

Most Linux distributions include some form of package management. Installing Sendmail using the distro-based binary packaged with your distribution is highly recommended. This Workshop focuses on how to build the Sendmail software from source. The basic steps to configure Sendmail from the distro-based binary or source code are more or less the same.

DNS CONFIGURATION

1 A correctly configured DNS is vital to setting up an email server. There are many records in a DNS configuration, but the two most important for setting up a mail server are the A and MX records. The A record converts a hostname to an IP address (the mail server), and the MX record defines the host that accepts mail for a particular domain.

The most efficient way to host an email server is with static IP addresses. If your ISP assigns IP addresses on-the-fly, consider using a dynamic DNS service to ensure mail is always delivered.

INSTALLING SENDMAIL

Sendmail is one of the most powerful MTAs

available and current versions include a configuration utility that helps create the sendmail.cf file automatically. You only need to work within the sendmail.mc file, listing features you wish to include in the configuration and specifying parameters for each feature. A Unix utility called m4 then mixes the configuration settings with actual sendmail.cf syntax to produce your personalised sendmail.cf file. A copy of sendmail-8.13.0 is on this month's cover CD.

The first step in the process is to decompress the gzipped tarball and change the directory to a newly created directory:

```
tar -zxvf sendmail.8.13.0.tar.gz
cd sendmail-8.13.0/
```

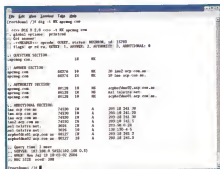

One of the easiest ways to compile Sendmail is with a Build script. The Build script uses the `uname` command to query which architecture is in use and creates the appropriate Makefile (see www.sendmail.org/compiling.html for more info).

2 Next, change to the `cf/cf/` directory, copy the generic-linux.mc file to sendmail.mc and build the sendmail.cf and install-cf files:

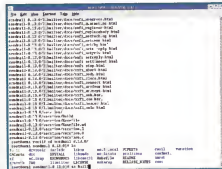

```
cd cf/cf/
cp generic-linux.mc sendmail.mc
sh Build sendmail.cf
sh Build install-cf
```

Create a new user and group called "smmmsp". Then install the Sendmail binary by changing directory back to sendmail/ and running `sh Build install`:

```
cd ../../sendmail/
sh Build install
```

1 A correctly configured DNS is vital to setting up an email server. The two most important DNS records for setting up a mail server are the A and MX records.

2 Sendmail is among the most powerful Mail Transfer Agents available. One of the easiest ways to compile Sendmail is using the Build script.

3 The sendmail.cf file is so complicated that it's madness to try and edit it more than once. It's far this reason that the sendmail.mc file exists.

To start the Sendmail service, type:

```
sendmail -bd -q30m
```

If you've installed a distro-based binary, the server may be controlled via the `/etc/rc.d/init.d/sendmail` script.

THE SENDMAIL.MC FILE

The `sendmail.cf` file is so complicated that it's madness to try to edit it more than once. That's why the `sendmail.mc` file exists — it's a lot easier to understand and edit, and enables configuration of most of Sendmail's parameters.

Lines beginning with `#` in the `sendmail.mc` file won't be parsed by `m4`, and will be put directly into the `sendmail.cf` file. This is useful for commenting on your configuration in input and output files. To put comments into `sendmail.mc` that you don't want entered into `sendmail.cf`, use the `m4` and `dnl` tokens. More info on `m4` is available from the manual pages (type `man m4`).

The following lines ensure that features such as the pathname of the help and status files, flags needed for the local mailer and so on are properly configured:

```
divert(`-1')dnl
VERSIONID('Linux')dnl
OSTYPE('Linux')dnl
```

As a spam prevention measure, a number of ISPs block outbound communication on port 25.

While this prevents the mail server from communicating directly with the outside world, there's nothing stopping you from using your ISP's SMTP server as a "smart host". This can also relieve your system of complex mail processing, the delivery of external mail, and so on. To define a smart host, look for the following line and edit it accordingly:

```
define('SMART_HOST', 'smtp.your
.provider')
```

There are dozens of additional lines that appear in the `sendmail.mc` file, most of which you won't need to concern yourself with for such a basic setup. However, look in `<path.to.sendmail.src>/cf/README` if you're after a full description for all settings. MAILER declarations should always be at the end of the configuration file.

Now it's time to regenerate the `sendmail.cf` file and restart Sendmail. This is done by using steps similar to those described earlier — just be sure to kill Sendmail before restarting it:

THE /ETC/HOSTS FILE

It's very important to have a correctly configured

`/etc/hosts` file. Sendmail uses `/etc/hosts` to determine both the system name and the domains it's responsible for relaying.

You must have a line in `/etc/hosts` that resolves the fully qualified domain name (FQDN) of the server, as well as an entry for `localhost` and `localhost.localdomain`. The server won't function properly if the `127.0.0.1` entry in `/etc/hosts` doesn't also include `localhost` and `localhost.localdomain`. For instance:

```
127.0.0.1    localhost.localdomain
localhost
192.168.0.1  mail.mydomain.com
mail
```

Sendmail will accept responsibility for any hostnames and domains listed in the `/etc/mail/local-host-names` file.

THE /ETC/MAIL/ACCESS FILE

You can ensure that only trusted users on your network can relay mail through your server using the `/etc/mail/access` file. The server will only relay mail from PCs that have their email clients configured to use the server as the "outgoing SMTP mail server".

Using this feature prevents the server being used by spam sites to relay mail. While it won't stop spam being received, it prevents others from using your server to propagate it.

The `/etc/mail/access` file has two columns. Column 1 lists specific domains and IP addresses. Column 2 specifies the action to be taken when mail from these sources is received — that is, OK, DISCARD, RELAY and REJECT. Sendmail will reject any mail relayed to the server that doesn't match any of the entries in this file.

Access can also be set on a per-email-address basis via the `/etc/mail/virtusertable` file.

To restrict relaying to the server itself and other servers belonging to the same domain, set it as follows:

```
localhost.localdomain  RELAY
localhost               RELAY
127.0.0.1               RELAY
mydomain.com            RELAY
```

A server will only be considered part of the same domain if its IP address is found in a DNS reverse zone file.

To allow relaying only for certain hosts (such as a computer with IP of 192.168.1.11), add the line:

```
192.168.1.11          RELAY
```

After changing your access file, rebuild the access database by running:

How your email works

■ **Receiving:** each user of your email server has an account, but mail sent to a user actually arrives at the server. Sendmail deposits the item into the mailbox file of the user's account. Users retrieve mail using client software supporting POP3 or IMAP mail retrieval protocols.

■ **Sending:** if mail is for a user within the local domain, Sendmail places the item in the recipient's mailbox for retrieval. If email is sent to an external recipient, Sendmail retrieves the MX record of the domain via DNS and relays mail to the appropriate destination server via SMTP.

ISPs blocking outbound port 25

Many ISPs block the outbound port 25, which is used for SMTP. This prevents the email server from sending mail unless Sendmail is configured to use your ISP's SMTP server as a "smart host". That way, all mail sent to recipients outside the local network will be sent via the ISP's SMTP server rather than directly from your mail server. This also avoids other potential problems because your ISP's SMTP server can deal with complex mail, and can send email via all sorts of mail transfer types (such as UUCP, Usenet and so on).

Inside info

- Sendmail
www.sendmail.org
- Dovecot
www.dovecot.org
- A Dynamic DNS provider
www.dyndns.com

```
cd /etc/mail
/usr/sbin/makemap hash /etc/mail/
access.db < /etc/mail/access
```

THE /ETC/MAIL/VIRTUSERTABLE FILE

The `/etc/mail/virtusertable` file tells the server what to do with received mail. Column 1 lists the email address. Column 2 contains either the corresponding user's local mailbox or a remote mail address to forward the email to. For example:

```
user1@domain.com      user1
user2@domain.com
user2@redirect.com
```

Here, mail addressed to `user1@domain.com` will be delivered to the `user1` mailbox. Mail addressed to `user2@domain.com` will be redirected to `user2@redirect.com`.

Like the access file, `virtusertable` should also be converted to a readable database:

```
cd /etc/mail
/usr/sbin/makemap hash /etc/mail/
virtusertable.db < /etc/mail/
virtusertable
```

THE /ETC/ALIASES FILE

This file can be used to set up simple mailing lists and specify aliases for local users. Column 1 contains mailing lists or virtual mailboxes, and column 2 contains the members of the lists. For instance:

```
# Basic system aliases -- these
# MUST be present.

mailer-daemon: postmaster

postmaster: root

# General redirections for pseudo
# accounts.
```

```
bin: root
abuse: root
# Person who should get root's
# mail

root: user1,webmaster@
domain.com
```

Mail sent to users `bin`, `daemon` and so on will be directed to user `root`. The final line shows that `root` is an alias for a mailing list with `user1` and `webmaster@domain.com` as members. It's important not to have any spaces between list members in this line as it will produce errors.

For mail addressed to `sales@mydomain.com` to be forwarded to `user1`, `user2` and `user3`, add the following line to the `/etc/aliases` file:

```
sales: user1,user2,user3
```

Then convert it into a sendmail-readable database file (`/etc/aliases.db`):

```
newaliases
```

INSTALLING AND CONFIGURING DOVECOT

Sendmail handles mail sent to your domain, and places it in each user's mail folder. In order to retrieve this mail using a mail client such as Outlook, you'll need to make your Linux box a POP3 mail server.

Dovecot (also included on the cover CD) is an IMAP/POP3 server for Linux which is easy to set up and low maintenance. If you

enter users into the `/etc/passwd` file, authentication is a breeze.

4 To install Dovecot under `/usr/local`, type:

```
./configure
make
make install
```

then rename the configuration file to:

```
mv /usr/local/etc/dovecot-
example.conf /usr/local/etc/
dovecot.conf
```

Make sure the following lines are uncommented and included in `dovecot.conf`:

```
protocols = imap imaps pop3 pop3s
imap_listen = *
pop3_list = *
```

More information on installing Dovecot and the required configuration settings can be found in its bundled documentation.

To start it up, simply run the Dovecot binary, use the appropriate method to start the service.

New users can retrieve mail using an email client and their local username and password on the Linux email server.

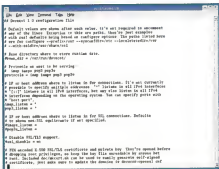

Double-check the configuration to ensure your server isn't set up as an open relay. The `/etc/hosts` and `/etc/mail/access` files must be configured correctly for the email server to work. To check the server for open relaying, use a computer outside of your domain and try to send email via your server. If the server is set up correctly, a rejection error will appear.

AUTHENTICATION

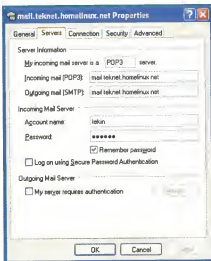

5 If you've followed all the instructions correctly, sending mail doesn't require authentication. To receive mail via POP3 or IMAP, use the username and password for the local user account created on the mail server.

You now have a functional email server running on your Linux box. You can send mail from the local machine and any machine you allow via the `/etc/mail/access` file. Email can also be received from any email client set up to receive messages via POP3 or IMAP from the mail server.

Troubleshooting information can be found in `/var/log/messages` and `/var/log/maillog`. [GITE](#)

4 Dovecot is an IMAP/POP3 server for Linux which is low maintenance and easy to set up. If you enter users into the `/etc/passwd` file, authentication is a breeze.

5 Sending mail doesn't require authentication. To receive mail via POP3 or IMAP, use the username and password for the machine set up as the email server.

Assistance from a distance

James Bannan demonstrates how to obtain or give help online using Windows

XP's Remote Assistance tool.

Telephone technical support lines and helpdesks aren't the only places you can turn to when you're experiencing problems with your PC. Based on the Remote Desktop Help Session Manager service, Windows XP's Remote Assistance tool is designed to make it easier for users to request, receive and offer help.

ASKING FOR HELP

There are two sides to a Remote Assistance session — the requester and the responder.

Before you can obtain help, Remote Assistance must be enabled to allow requests to be made. To do so, right-click on My Computer and select Properties > Remote and check Allow Remote Assistance invitations to be sent from this computer to start the service. Then select Advanced and enable Allow this computer to be controlled remotely; this allows the person helping you to take control of the desktop from their PC.

It's important to note that Remote Assistance and Remote Desktop are entirely different functions. The latter permits anyone to connect to your machine providing they can supply the correct credentials. The former, on the other hand, is instigated and controlled by you.

To get Remote Assistance running, MSN Messenger must be installed. The latest version can be downloaded from <http://messenger.msn.com>, or from this month's cover CD. If you don't have a login, you can assign a Microsoft .NET passport to any email address you like, including Hotmail addresses. Once signed in, you need to add the person you're going to ask for help to your Contacts list.

To request assistance, click Start > Programs > Remote Assistance. Select the person that you want to obtain help from by highlighting their name under Use Windows Messenger. Then click Invite this person.

The request is sent and is either accepted or declined. Once it's been accepted, a prompt will ask whether you're ready to allow the person to view your screen and chat. Click Yes.

Move your cursor around the screen, and the person you've asked for help will see whatever you see. If you want to talk to each other, you can use the MSN-style chat screen, or even a microphone and headset.

LEND A HELPING HAND

Obviously, you need to be signed in to MSN Messenger in order to give help to others.

As the person giving the assistance, things look a bit different. When a friend requests your help, a typical pop-up appears. Click Accept (or Alt+C) to allow the request. A blank Remote Assistance screen opens on your screen, but more details appear when the requester allows you to view their screen.

At this point, you can't do much more than see what's going on. Both of you have a cut-down MSN Messenger window which allows you to chat, disconnect, send files or alter the settings of the session. If your resolution is too low to see the remote screen properly, select Scale to Window to get a full view.

If all you're doing is giving advice, the chat facility alone is sufficient. However, click the Take Control button at the top left of the screen if you need to get more hands-on. The remote user will be asked if they want to allow this — if they accept, you take the helm but they can see what you're doing.

Control can be terminated by either person at any time by pressing Esc (or any key combination including Esc, such as Ctrl+Esc). Alternatively, click on Release Control.

OTHER ISSUES

If the person requesting help is behind a firewall or NAT device, they need to open up or forward port 3389 for Remote Assistance to work. Additionally, the default XP user Help Assistant must be present. If this user has been erased, the system needs to be restored to a stage when the user was there (using System Restore), or XP SP1 needs to be applied, which resets the user details.

Remote Assistance is a stable and secure method of seeking help that's often much more practical than helpdesks and tech support lines. And it's just as good for business environments as single users. The only downside is that it's almost totally dependent on Microsoft components to work properly. Start customising Windows too much and you may find Remote Assistance is no longer an option. www.microsoft.com/windows/remoteassistance

Requirements

An installation of the Apache Web Server.

Time to complete

1 hour (approx)

Almost everyone has visited a Web site that has required a username and password in order to access content. Supply valid credentials and the server will forward the requested file. Failure to offer a recognised password and username can result in a 401 (Unauthorised) error message.

It often makes sense to restrict areas of your server for certain purposes. It might be because you want to prevent the general public from accessing confidential information, or because you want to hide your Web-based video gallery (see "Disc or drive?", page 90, for more information on video gallery creation).

MANAGING HTTPSSWD FILES

The easiest way to restrict access to your server is through the use of files created with the `htpasswd` command. Setting up this method of authentication requires two steps: the creation of a file that stores user credentials, and configuring Apache to use this file.

The file that stores user credentials can be given any name, but must contain only one username per line. Each password is hashed to prevent others with access to the file from finding out everyone else's password.

To create a file and add the first user to it, type in:

```
htpasswd -c <filename> <username>
```

After hitting Enter, you'll be prompted to key in a password for that user. The `-c` switch is specified to create the file. To create additional users, the `-b` switch should be used as follows:

```
htpasswd -b <filename> <username>
```

For Apache 2.0.46 or later, users can be removed from the file by specifying the `-D` switch. Note that this is an upper case "D" designed to prevent the accidental deletion of users:

```
htpasswd -D <filename> <username>
```

Alternatively, if you're using an earlier version of the Apache Web Server, you can edit the password file with the editor of your choice by removing the line containing the username you want to delete.

After you've set up the password list, Apache must be configured to use it. Authentication methods are usually placed over entire directories, so the following block of code could be placed within an `.htaccess` file or within a `<Directory>` block in the `httpd.conf` file:

```
Satisfy All
AuthName "APC Magazine :: Login"
AuthType Basic
AuthUserFile /path/to/filename
Require valid-user
```

If you use the same `htpasswd` file for a number of locations and only want certain users within the file to have access to a particular resource, replace `Require valid-user` with:

```
Require <user_1> <user_2> ...
```

USING DIGEST AUTHENTICATION

The biggest weakness regarding the use of `htpasswd` files lies in how credentials are transferred from client to browser. When a client authenticates with the server, the password exchange is not encrypted in any way and is sent via plaintext. This gives malicious users the chance to intercept the password en route to the server, allowing them to use the credentials.

One solution is to use digest authentication. This forces the client browser to send an MD5 hash of the username, password and realm in order to mask the input credentials. The one drawback of this method is browser support. While most modern browsers support digest authentication, some don't, so the platforms your visitors use may force you to adopt a more basic authentication method.

The process for setting up a digest authentication password file is similar to setting up an `htpasswd` file. To create the file and insert the first user:

```
htdigest -c <filename> <realm> <username>
```

After entering the command, you'll be prompted to enter a password. In order to add further users to the same file, use:

```
htdigest <filename> <realm> <username>
```

Apache also needs to be configured to use digest authentication as opposed to basic. The

AuthType directive must be changed to:

AuthType Digest

WEAK VERSUS STRONG

Entering credentials into a window is called weak authentication because it's possible for unauthorised users to obtain these same credentials and log in using them. A strong authentication credential is generally more difficult for unauthorised users to meet. For instance, limiting access to a range of IP addresses is the most common way that strong authentication is implemented.

For example, if you've set up a section of your Web server for an intranet that will only be used by people connecting from your local network, you should also set up an htpasswd file that limits what users can access on the site. In this case, you'd need to implement both strong and weak authentication methods.

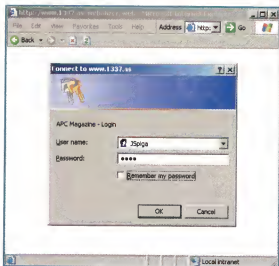

The following could be inserted in a .htaccess file or within a <Directory> block in your httpd.conf file:

Satisfy All

```
AuthName "Text"
AuthType Basic
AuthUserFile /path/to/
filename
Order deny,allow
Deny from all
Allow from 192.168.1
```

With this code in place, a client will be prompted for their username and password whether they come from a valid IP or not. If authentication cannot be confirmed, an Unauthorised (401) error message will appear. If valid credentials are supplied, the next test occurs.

The second last line of code specifies that all users will be denied access to the resource by default, while the last line grants access to any user who has been authenticated via login credentials, provided they are using a PC on the 192.168.1.x network. Therefore, if the client has authenticated from a host that's not on the 192.168.1.x address range, they'll receive a Forbidden (403) error.

Hold! Who goes there: forcing users to enter credentials to access content is a good way to keep your data private.

SATISFACTION GUARANTEED

When you implement authentication in a directory, the same authentication method applies to all files and subdirectories contained within that directory. However, there will undoubtedly be occasions where you'll need to lift restrictions on some

LabelWriter
DYMO saves you DYMO

resources within this tree. The following could be used in a .htaccess file located in a certain subdirectory to prevent the authentication method from being inherited from a parent directory:

```
Satisfy Any
Order Deny,Allow
Allow from all
```

In similar fashion, if you want to remove authentication inheritance from a specific file, use the following:

```
<Files index.html>
Satisfy Any
Order deny,allow
Allow from all
</Files>
```

In these cases, the **Satisfy Any** directive instructs Apache to accept any authentication, whether weak or strong. Below this directive, a strong authentication method has been defined. **Allow from all** grants access to everyone, thereby meeting the requirement of the **Satisfy** directive, and removing the need to supply authentication credentials.

STORING CREDENTIALS IN A DATABASE

Storing usernames and passwords in plaintext files is a long way from being the most secure solution. Anyone who has access to those files can easily identify valid usernames for the resource, meaning that half of the hacking objective is already done. A more secure way to store credentials is by placing them within a MySQL database.

Setting this database up is a relatively straightforward task. However, different procedures exist for the different versions of the Apache Web Server.

Regardless of which version of Apache you use, the first step is to create your database and then a table within that database. It's easiest to use a tool such as phpMyAdmin, but if you have to resort to using a command prompt, enter:

```
% mysqladmin create
<db_name>

% mysql <db_name>
mysql > create table <table_name> (
-> username char(25),
```

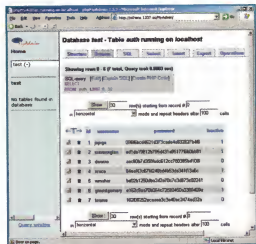

```
-> passwd char(25),
-> groups char(25),
-> isactive tinyint(1),
-> primary key (username)
-> );
```

Next, you have to tell Apache to use the database. Under Apache 1.3, this is done by using **mod_auth_mysql** (a module specifically designed for administering authentication with MySQL databases) before a **<Directory>** block in **httpd.conf**:

```
Auth_MySQL on
Auth_MySQL_Info <host-
name> <db_user> <db_pass-
word>
Auth_MySQL_General_DB
<db_name>
Auth_MySQL_Password_Table
<table_name>
<Directory /path>
AuthName "APC Magazine :
: Login"
AuthType Basic
Require valid-user
</Directory>
Auth_MySQL off
```

Under Apache 2.0, a different module has been created in order to offer support for storing credentials in other databases, as well as in MySQL databases. The **mod_auth_dbi** module uses the **libdbi** package as a backend to accomplish this. A different syntax is also used under Apache 2.0 to cater for this module:

```
AuthnDbiDriver <config_name>
mysql
AuthnDbiHost <config_name> <host-
name>
AuthnDbiUsername <config_name>
<db_user>
AuthnDbiPassword <config_name>
<db_password>
AuthnDbiName <config_name>
<db_name>
AuthnDbiTable <config_name> <table-
name>
AuthnDbiUsernameField <config-
name> username
AuthnDbiPasswordField <config-
name> passwd
AuthnDbiIsActiveField <config-
name> isactive
```

User database: Apache can look up user information from MySQL databases. Just make sure that access to the database is restricted.

```
AuthnDbiConnMin <config_name> 3
AuthnDbiConnSoftMax <config_name>
12
AuthnDbiConnHardMax <config_name>
20
AuthnDbiConnTTL <config_name> 600
<Directory /path>
AuthType Digest
AuthName "APC Magazine :: Login"
AuthBasicProvider dbi
AuthnDbiServerConfig <config-
name>
Require valid-user
</Directory>
```

where **<config_name>** refers to a name used to ensure that all variables passed on to the **mod_auth_dbi** module are applied to the correct configuration. This module supports the use of multiple configurations simultaneously, allowing for great flexibility. For instance, it lets you create two configurations that use different database technologies, or allows for two configurations that use different tables within the same database.

Once Apache is querying the database, the users have to be added to the database. For a complete rundown on Apache 1.3's **mod_auth_mysql** module, see www.diegonet.com/support/mod_auth_mysql.shtml. Apache 2.0's **mod_auth_dbi** module is still under development, and documentation for it is difficult to come by. However, http://open.cyanworlds.com/mod_auth_dbi is a good place to start. **ETC**

On the mend

A virus attack on a Windows PC needn't be a total disaster.

James Bannan details how to recover from such a situation.

When your machine starts rebooting and your inbox is filling up with emails titled "Re: Hello", you've probably copied a virus. But installing a virus scanner at this stage isn't enough, as many viruses are clever enough to hide themselves or even prevent virus software from functioning properly. So what can you do?

DIAGNOSIS

What's the difference between an innocent error message and a virus? With a dodgy application, the error should be consistent and reproducible. A virus is more subtle, or at least it's supposed to be. Blatant symptoms such as reboots are caused by faulty code within the virus causing a Windows component to crash (such as Sasser). These viruses are easier to troubleshoot as they usually give a specific error message and the effect is obvious. Symptoms of other viruses include:

- Windows taking longer to load. Some viruses activate on startup before the OS loads properly, extending the boot time.
- Unfamiliar processes running. From the Processes tab in Task Manager (Start > Run > taskmgr), you can view a list of the apps that are running. Then, run regedit and navigate to HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Run. This gives a list of the apps launched on startup. Any processes which look unfamiliar or don't relate to any installed application should be regarded as suspicious.
- Applications failing to load. Some viruses prevent programs (such as virus scanners and regedit) from running, which can be used to track them down.
- Hard drive constantly reading. Although this is more likely evidence of a fragmented drive, if the HDD LED is constantly on, Windows is working overtime.
- Email inbox filling with junk.
- Undeliverable email. If you're receiving bounce-back replies to email you didn't send, your machine is almost certainly being used as a platform for launching viruses.
- Network/modem connection always busy. Check the connectivity lights in the system tray. If they're on all the time, even when idle, your machine is sending/receiving information in the background.

STOMP THOSE NASTIES

If you suspect your PC is infected with a virus,

figure out which one is giving you grief. Online virus libraries are the best sources of information. These are databases maintained by the main antivirus/security companies and contain a catalogue of virus threats. The most frequently used libraries are located at:

- <http://securityresponse.symantec.com/avcenter/vinfo/db.html>
- <http://us.mcafee.com/virusinfo/default.asp>
- www.viruslist.com/eng/viruslist.html

If you find information relevant to the problems you're experiencing, the next step is to neutralise them. Installing an antivirus package won't be effective enough, but there are a few other options available:

- Most viruses have a recommended removal method. This will be documented in each online library reference and generally involves booting into Safe Mode, editing the registry and possibly deleting system files.
- Use a removal tool. Wherever possible, security companies will create specific virus removal tools which are very effective. Download the relevant tool for your identified virus and run the application. You may need to do this in Safe Mode.
- Use an online virus scanner. These are free services offered by various companies. You have to allow the remote server to install whatever it needs onto your machine — usually an ActiveX control or Java applet. This gives the remote server access to your local files and lets it perform a thorough scan. See "Inside info" for a list of online scanners.

SAFE, NOT SORRY

If you hit F8 during Windows' boot process, you'll see a boot menu. Safe Mode is great for running virus checks as a minimal driver set has been loaded, hardly any services are active and Windows isn't holding onto as many files. Some viruses can only be removed in Safe Mode.

However, prevention is better than cure and nothing beats an up-to-date computer with the latest virus signatures. But don't despair if you run foul of an Internet nasty. The road to PC health requires a bit of manual effort, but there are plenty of ways to cure those infections. tiny.cc

Online scan: even if you don't have antivirus software installed, a number of online scanners can identify nasties on your system.

■ Advanced BASH
Scripting Guide
www.tldp.org/LDP/abs/html

■ BASH Scripting FAQ
[www.splike.com/howtos/
bash_faq.html](http://www.splike.com/howtos/bash_faq.html)

When designing an application with a graphical user interface, programmers have to anticipate all the possible ways in which a user will interact with it. No matter how intuitive and user-friendly this may seem, it constrains the user to working only in predicted ways. This is fatal when they have to deal with unforeseen tasks and circumstances.

Thankfully, Linux lives up to the Unix philosophy and includes many small, simple tools that each perform a single task well. Through the use of shell scripts, these tools can be combined to solve almost any complex task as a series of simple operations.

BOURNE AGAIN

Shell scripts consist entirely of commands you'd otherwise execute in a terminal. Since scripts can be written in many different languages and each needs to be handled differently, the first line of any script should point to an interpreter that can understand and run it.

The default shell provided with almost every distribution of Linux is called the GNU Bourne Again Shell, or BASH. Thus, the first line of a script should contain:

```
#!/bin/bash
```

In order to run a script from the command line, it needs to be made executable. Assuming the script is called "hello", this can be done using:

```
$ chmod +x hello
```

Then run the script by typing:

```
$ ./hello
```

VARIABLES AND ARGUMENTS

User-defined shell variables can be used to hold strings of characters. Unlike many programming languages, there's no need to declare them beforehand. You can start using them by assigning a value to an alphanumeric name.

To retrieve a variable's stored value, precede the name by a \$. For instance:

```
#!/bin/bash
name=Andrew
echo $name
```

If you need to combine a variable with more characters, braces should be used around the variable in order to disambiguate, otherwise the shell will mistakenly believe you are referring to another variable. For example, `${x}y` should be used to echo the contents of `$x`, followed by the letter `y`. Also, avoid spaces around the equals sign.

To treat a variable as a number instead of a string, a pair of parentheses is required. The following example will return a result of 3:

```
x=1 y=2
echo $(( $x + $y ))
```

If a variable containing a string is treated as a numeral, the value of that numeral will be zero.

Arguments are inputs passed on to your script at the time it's run. Access them by using some of BASH's built-in shell variables (see the table on page 119). For example, assume that you have the following script, named "bigfiles":

```
#!/bin/bash
du -ak $1 | sort -nr
```

This script reports the disk usage (`du -ak`) of all files within the directory passed into the script by the first argument (`$1`). It then sorts the result in reverse numerical order (`sort -nr`), so that the biggest files appear at the top of the list. To make this script generate a report for the `/var/log` directory, the following command is used:

```
bigfiles /var/log
```

CONDITIONALS

The above example is fine if you want to run commands in sequence, but what happens if commands should only be run when certain conditions are met? Like any programming language, conditional statements can also be used in scripts to alter the flow of execution. The most basic of these is a regular `If . . . Then . . . Else` statement. For instance, the following could be used to ensure that arguments have been passed to your script:

```
if [ $1 = start ]
then
echo "Process is starting..."
else
echo "Process terminating!"
fi
```

The drawback with `If...Then...Else...` statements is that they are binary — either something equals another thing or it doesn't. If you need to match a range of conditions, the case statement should be used. In a similar example:

```
case "$1" in
start)
echo "Process is starting..."
;;
stop)
echo "Process terminating!"
;;
*)
echo "Usage: script {start|stop}"
;;
esac
```

ITERATION

Looping through a sequence of lines is the other form of control structure in procedural programming. Shell scripts also have the ability to do this. `while` loops are often used to loop through a section of code as long as a certain condition is met.

The following script counts down each second, for the amount of time specified by an argument. It does so by running the code located between `do` and `done` lines, so long as `count` is greater than 0:

```
count=$1
while [ $count -gt 0 ]
do
echo $count
let count=count-1
sleep 1
done
```

A similar loop is the `until` loop. This runs until a certain condition is met, as opposed to running while a condition holds true. The above script could be modified to incorporate an `until` loop as follows:

```
count=$1
until [ $count -lt 1 ]
do
echo $count
let count=count-1
sleep 1
done
```

The last iteration method that can be used, and the most useful, is a `for` loop. This works through a list, executing the code contained within the loop once for each item, and then terminating. The above example could be rewritten to incorporate this counting loop as follows:

```
for (( count=$1; count ;
count=count-1 ))
do
echo $count
sleep 1
done
```

A `for` loop starts its operation by evaluating the first expression (the variable `count` is assigned the value supplied to the script as an argument). The loop then evaluates the second expression (that is, it checks if `count` is equal to zero) to see if the loop should be executed.

If this evaluation proves false, the commands between `do` and `done` are executed (the value of `count` is echoed to the screen, and the process waits one second). After the instruction execution has completed, the third expression is evaluated (the value of `count` is decremented), and the second expression is then re-evaluated.

For loops may also be used to process lists of strings. For instance, if you have a list of capital cities on the eastern seaboard of Australia and each string has to be echoed to the screen, the following could be used:

```
for cities in Brisbane Sydney
Melbourne
do
echo $cities
done
```

This basic example prints the name of the three cities to the screen, each on a new

line. A more practical example would be to create a copy of all files within a directory, and append a `.bak` extension to each one:

```
for file in $*
do
cp $file $file.bak
done
```

COMMAND SUBSTITUTION

Another powerful feature is command substitution. This allows you to use the output of an executed command within your script — more flexible than piping or redirecting output. Command substitutions are surrounded in back quotes (`).

As a practical example, consider the following script named "search":

```
#!/bin/bash
if [ $# -eq 0 ]
then
echo "Usage: search {string}"
else
grep -l $1 `find . -name "*"
-type f`
fi
```

Provided a search string has been supplied to the script, the command contained within back quotes is executed first (the `find` command lists all files within the current directory). The output from this command is then used to execute the rest of the statement (`grep` removes all lines not containing the search string).

EXIT 0

This Workshop has only covered some of the BASH shell's most basic features. To learn more, take a look at the Advanced Bash-Scripting Guide (www.tldp.org/LDP/abs/) or the manual page for BASH. [EXIT 0](#)

Reinventing the DJ

Having evolved from disc jockey to digital jockey, the new generation of DJs is spinning hard disks, not vinyl.

Daniel Winter explains how you can do it too.

Bonus CD software

MixVibes 5 Free
(Windows) • MixVibes
5 Pro demo (Windows)
• Traktor DJ (Windows/
Mac OS X) • Virtual DJ
MKIII (Power Macintosh)
• DJPlay (Linux).

Skill level

Intermediate

Requirements

MixVibes 5 Free
(Windows) • MixVibes
5 Pro demo (Windows)
• sound card (two
recommended)
• speakers and/or
headphones.

Time to complete

2 hours (approx)

The rise of the DJ as cult hero implies that there is more to it than just playing records. In recent years, many DJs have migrated from vinyl to CD and, with the advent of specialised software, some only mix digitally on laptops.

PREPARING THE MIX

This Workshop demonstrates how you can use MixVibes 5 DJ software to mix, match and loop MP3s into sets for live performance or for burning to CD. The first step is to configure the software and prepare some MP3 files for the mix. With this groundwork laid, the basic techniques of tempo synchronisation and cross-fading can be explained. Then more advanced techniques available in the registered version of MixVibes Pro can be explored, like using kill frequencies, sampling loops and scratching with vinyl effects.

1 Install MixVibes 5 Free (included on this month's cover CD), fire it up and click every orange icon in the toolbar to enable all windows on offer. In the Explorer pane on the left-hand side, browse for MP3 files and drag them into the playlist window at the top of the screen. Alternatively, use the scan feature to have MixVibes automatically locate MP3s for you.

2 Once a few files have been queued in the playlist, drag a different track onto each of the playback units ("decks") in the centre of the screen. You'll be able to play these files using the controls, just like any other media player. The difference here is that both players are side by side, allowing you to cross-fade between the two using the slider at the bottom of the screen. Experiment with the cross-fader to familiarise

yourself with the deck controls. If you can't hear anything, check the sound card settings in the Control Panel — MixVibes uses the default audio preferences for your system.

The most basic principle with DJing is to synchronise the two decks so that both selected tracks are playing at the same tempo with the beats matched. Start with slower tempo music with regular kick drums — like house or techno. Learning to beat mix with 180bpm jungle is courageous, but can be a frustrating experience.

BASIC BEAT-MATCHING

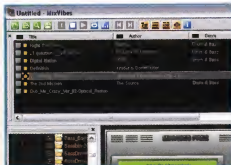

3 With both decks playing and the cross-fader in the left position, get a feel for the song playing in deck 1. With this beat in mind, slide the fader over to deck 2 and compare the tempo. If it's faster, slide the speed control upwards to slow the track down (if the mode indicator says "tempo" or "pitch", click it until it says "speed" before changing the slider). Alternatively, you can use the +/- Pitch buttons beneath the green LCD-style display to finetune the speed.

Now, try bringing deck 1 back into the mix and compare the beats. It takes quite a bit of tweaking to get the two in sync, and this is where the arrow Search buttons become helpful. These can be clicked to jog the playback slightly forward and backward to realign the beats. If the tempos are even slightly out, they'll slip out of sync every few seconds. The Search buttons can bring them back into alignment as you adjust the speed.

Once the two tracks are beat-matched, you can get creative with cross-fading. While a slow cross-fade at the end of a track is a classic way of mixing, it isn't very interesting to perform or listen to. More sophisticated tricks involve cross-fading in time with the music and using the equaliser settings to change the frequency blend of the two pieces of music. For instance, it's possible to have

1 MixVibes 5 Free provides two playback decks and a cross-fader, emulating CD DJ hardware.

2 The playlist pane at the top of the screen provides quick access to your music collection — just drag-and-drop tracks onto the decks.

3 The vertical speed sliders bring the tempos of each track into sync and the search buttons help align the beats.

the cross-fader at centre position and highlight the bass line of one deck by cutting the bass frequency of the other. The same thing can be done to minimise or feature vocals with the mid-range and drum hits with the high-end. Performing these techniques with a mouse and keyboard is very cumbersome, which is why MixVibes Pro supports external hardware controllers — and automatic beat-matching too.

ADVANCED TECHNIQUES

Another thing about beat-matching is that your audience shouldn't hear you do it, which is why you need an audition function when DJing to a crowd. Although the free version of MixVibes is great for honing your skills, it doesn't have any preview features, making it useless for live mixing.

The Pro version allows you to use two sound cards — one for the mix and one for headphone auditioning. Alternatively, professional sound cards with multiple outputs can be used for the same purpose. To beat mix this way, one deck is sent to the main speaker output with the cross-fader, and the other is sent to the headphones with the monitor button on the deck. **4** Enabling the auto-bpm button in the toolbar results in white lines appearing in the waveform display of each deck (this option is also available from the Settings window under the File menu). These indicate the beat points and the tempo is displayed below in bpm. To automatically synchronise one deck to the other, click the A=B or B=A button below the cross-fade slider.

In addition to the three equalisation knobs found in the free version, MixVibes Pro includes kill switches for each, allowing you to drop out the specified frequency by clicking the button. This allows you to perform synchronised tricks such as dropping the bass line in and out. Even better is the EQ cross-fader located next to the standard cross-fader. By centring this slider and clicking the Cross EQ button, the three adjacent sliders can be manipulated to cross-fade the bass, mid-tone and treble frequencies of the two decks.

SAMPLE LOOPS

5 Another great trick borrowed from samplers is to extract a beat loop from one of the songs and play it indefinitely. This is great for extending peak sections of tracks as well as experimenting with tricks on the other deck, knowing all the while that your backing beat won't suddenly disappear. To use the loop sampler, which is located next to the playback controls in each deck, click the number of bars you want the loop length to be (1/2, 1, 2, 4, 8 or 16) followed by either the forward or reverse arrow button. To escape a loop once it's playing, click the Play button to continue.

VINYL TRICKS

6 For a classic vinyl effect such as the rewind used in drum 'n' bass tunes, click the Vinyl button on a deck and turn the jog shuttle control using the mouse. You can also click-and-drag in the waveform window. Not only does this recreate the sound of scratching records, but it can also be used to nudge the playback to retain sync. The slider beneath the jog shuttle will also do this, and both techniques are a vast improvement on the Search controls found in the free version.

For scratching, the vinyl effect settings need to be tweaked using the vinyl window (enabled via the turntable icon on the toolbar). The noise and crackle settings are simulation sound effects for damaged records, but the sensitivity and time controls relate to the scratching speed and the acceleration and deceleration of the turntable when starting and stopping playback.

MIXDOWN TO MP3 OR CD

When you're ready to record your mix, click the record button in the mixer window and enter a filename. The mix will be saved to WAV, which you can later convert to MP3 or burn to CD. Alternatively, capture the mix using the record button in the toolbar. This creates a VIB sequence file for later editing, which is a great way to tidy up mixes for export to WAV or MP3 (via the Mix menu). **7**

Other DJ applications

Traktor DJ for Mac and Windows is similar to MixVibes and has excellent automatic beat-matching. It also provides custom keyboard shortcuts for common DJ tricks like using kill frequencies and rapid cross-fades. For Linux, there's DJPlay, although it won't perform any beat-matching for you. For true DJ scratching with specialised hardware, Final Scratch is a commercial application for Mac OS X, Windows and Linux that allows you to use standard turntables to mix MP3 files.

Inside info

- MixVibes
www.mixvibes.com
- Traktor DJ
www.nativeinstruments.com
- Virtual DeeJay MKIII
www.freenetpages.co.uk/hp/all.reid/index.htm
- DJPlay
<http://djplay.sourceforge.net>

4 MixVibes Pro provides a lot more features, including automatic beat-matching and mix recording.

5 The loop controls next to the cue button provide real time sampling of the current track for prolonging breakdowns while mixing in the other deck.

6 The vinyl controls can be used to emulate record noise and DJ scratching mixing techniques using the mouse.

Just add water

The basic principles of water-cooling are simple, but the installation details vary for each system. *James Rolfe* takes you through the installation of a typical water-cooling kit.

Skill level

Beginner to intermediate

Requirements

Phillips head screwdriver • small pliers • cable ties.

Time to complete

1 to 4 hours (varies with kit complexity).

Inside info

- Water-cooling.com
www.water-cooling.com
- Overclockers Australia
www.overclockers.com.au
- Ultimate Water-cooling Guide
www.spodesabode.com/content/article/watercool

For many, water and computers sounds like a catastrophic combination. However, when used properly, these solutions have many advantages. First and foremost is cooling performance. Traditional heatsinks and fans struggle under the load of gaming when installed on today's high-end CPUs, not to mention the hot air from the video card.

Water-coolers transport heat away from a CPU to a larger, more efficient radiator, taking advantage of the ambient air outside the case. There's also a significant advantage in terms of PC noise — instead of a single 60mm or 80mm fan screaming away on top of the CPU, a radiator can accommodate a larger, slower and quieter fan.

Leaks are a major concern of water-cooling, but the risk isn't as great as you think. A small leak usually won't damage components — even if the system is powered at the time — as long as it's shut down and swiftly cleaned up. Most PC components run on low-voltage supplies, reducing the risk of shock, but make sure that no conductive fluid leaks into your power supply.

TESTING, TESTING

1 Checking your water-cooling system for leaks or problems before installing it into your PC is always recommended. Some kits (such as our demonstration model, the Global WIN Silent Stream) come with pre-connected hoses already filled with water. If yours doesn't, read the instructions on connecting the hoses and correctly filling the system with fluid.

It's best to do this on a towel or in a sink. If your kit has an internal power connector, test it next to your running PC. Don't be too concerned with powering the fans at this point — just make sure that everything is watertight.

Once the pump is running, check for leaks in the water blocks, seals, pump, radiator, reservoir and on all hose connections. Check that fluid is actually flowing by gently squeezing each part of the hoses and monitoring the flow indicator (assuming the kit has one).

Air bubbles in the lines can reduce the efficiency of the kit. Elevate the reservoir or drain pipe so it's above all other parts in your system and gently tap all of the components to dislodge any bubbles.

GETTING YOUR HANDS WET

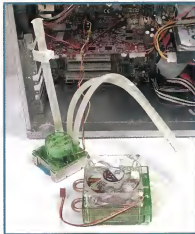

Once you're satisfied that the system is working without leaks and bubbles, it's time to install it.

2 First, unplug the PC from all mains power and remove the existing CPU cooler. If the radiator in your kit replaces a case fan, remove that fan too. In the demo unit, an 80mm exhaust fan near the CPU was removed.

3 The water block is the main component of any kit. This presses against the CPU core and is responsible for drawing heat away from your CPU and into the fluid. Most blocks can be attached to a variety of CPU sockets.

In common with conventional heatsinks, each manufacturer has its own idea about the best way to attach a block to the CPU socket. Connecting the block to Socket 370 and Socket A systems uses the socket lugs, or the four holes through the motherboard around the socket, for retention.

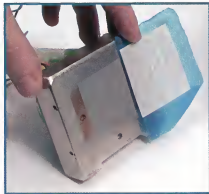

With Socket 478, the plastic frame used for mounting the stock heatsinks is often used, but

1 Test any water-cooling kit outside your PC first to detect any leaks.

2 The noisy heatsink fan needs to be removed before the water block is affixed.

3 The underside of a water block is identical to most heatsinks, down to the copper core and thermal pad.

occasionally this frame has to be removed and the mounting holes are used for the water-cooling system. If you have a newer CPU such as an Athlon 64 or LGA775 Pentium 4, make sure the kit can be affixed to your motherboard.

❗ Correct clamping pressure between the water block and CPU core is vital. Too little pressure and thermal transfer will be inefficient — the CPU will run hot while the fluid stays cool. On the other hand, too much pressure can damage the CPU core or motherboard. Most kits include some kind of sprung mechanism to ensure the correct clamping pressure. The Silent Stream mounts on an AMD Socket A CPU with a simple metal clip. A screw knob on the top applies the correct amount of pressure when it's fully tightened.

APPLYING PRESSURE

As with an air-cooled heatsink, using a thermal pad or paste is a good idea. This smoothes out any minute surface irregularities and prevents air bubbles from interfering with thermal transfers from the CPU core to the water block.

Thermal pads are single use and need to be replaced with thermal paste if the block is used elsewhere. When applying thermal paste, only a very thin, translucent layer is required on the top of the CPU core. Too much paste is not only messy, it makes the system less efficient.

Some kits include additional water blocks for the motherboard Northbridge or the GPU on the video card. These blocks occasionally use existing retention clips of plugs, much like the CPU block. If you have no way of fixing the block to the chip, use a small amount of thermal adhesive. Using a kit with these extra water blocks allows you to build a whisper-quiet PC.

❗ At the other end of the cooling system is the radiator. This transfers heat from the fluid to the surrounding air. A fan is usually used to force air through the radiator, but if you're after a silent solution, fanless radiators are available. In many

instances, the radiator is designed for use in a standard case fan-mounting location.

For extra performance, mount the radiator outside the case and make sure that the fan draws air from the exterior, through the radiator, and into the case. This boosts the performance of the radiator and the entire cooling system. Long screws go through the normal 80mm fan mounting holes in the case and are secured with small nuts.

If your kit contains an isolated pump, mount that next. In some kits, the pump is located inside the water block. In others, the pump may be in the reservoir or housed separately.

HOLD YOUR BREATH

❗ After installation is complete, test the system in the same way you did before the installation. Once any or all bubbles have been removed from the pipes, keep monitoring your system for at least the next hour in order to make sure there are no leaks and that the CPU and other components remain cool. During this time, run a game, application or benchmark that makes heavy demands on the CPU to run in the new cooling rig.

As soon as you're completely satisfied that everything is working properly, use cable ties to tidy up the hoses — this keeps them from moving around in the case where they could become crimped. Don't tie them too tightly or you'll restrict the coolant flow.

Keep an eye on the fluid levels — most kits are prone to evaporation and require top-ups every few months. A lot of systems use distilled water, but check the manual as it may have other specific fluid requirements.

Finally, moving a PC with a water-cooling system can be problematic. Draining it before you take it to a LAN party is a good idea. Moving the PC can also introduce air into the pipes, so if draining the kit is inconvenient, flush the system before getting into the gaming action. [ITTE](#)

Galvanic corrosion and green slime

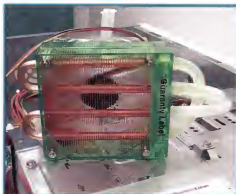

One of the big concerns for DIY water-coolers is galvanic corrosion. It occurs when a cooling fluid acts as an electrical conductor between two different metals, causing one to corrode rapidly. Early Senfu water-cooling kits were infamous for this. Their aluminium water blocks and copper radiators formed a primitive battery which, over the course of a few months, badly corroded the water block internals.

Also, algae can thrive in the nice warm water. Over time, it can form slimy colonies which reduce the efficiency of your system or stop it working entirely.

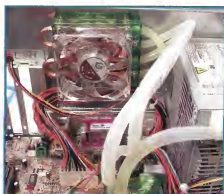

Manufacturers have been well aware of these issues for some time, so any modern water-cooling systems ought to be specifically designed to prevent either from occurring. The crucial component is the fluid itself. Most kits come with a special, non-electrically conductive, algae-inhibiting liquid — usually distilled water with an additive.

❗ Too little clamping pressure reduces cooling efficiency, but too much can damage your CPU.

❗ The radiator works just like those found in cars — air passing through the fins cools the water.

❗ The final result. Cable ties can be used to manage your pipes, but don't fasten them too tightly.

Making connections

Anthony Caruana guides you through the process of getting your Pocket PC wirelessly connected to the Web.

Bonus CD software

- vxUtil Personal 1.6.1
- vxIPConfig 0.9.5
- pocketWinc 2.0
- MiniStumbler 0.4.0.

Skill level

Intermediate

Requirements

PDA with Windows Mobile 2003 Software for Pocket PC or Windows Pocket PC • integrated Wi-Fi or an external adaptor • wireless access point or router, connected to the Internet.

Time to complete

1 hour (approx)

On the road

If you want to access the Internet with your PDA while you're on the road, you can connect via publicly accessible wireless hotspots. While there are a few free ones around, you generally need to register to gain access. The main trap for users is that registration may not support Pocket Internet Explorer, as it doesn't comply with all the latest authentication standards.

MiniStumbler (<http://stumbler.net>) is a free tool that scans for available WLANs. PocketWinc (www.cirond.com) delivers a WLAN sniffer but includes ping, trace route and automatic testing of an Internet connection. It can also record signal strength in a CSV file, making it handy for finding transmission blind spots.

Make sure you have My Work Network set for automatic Internet connection.

TROUBLESHOOTING TOOLS

Your network card may have its own tool for telling you the device's IP address and carrying out basic commands like ping to test network connectivity. If not, vxUtil Personal (www.cam.com/vxutil_pers.html) and vxIPConfig (www.cam.com/vxipconfig.html) can be invaluable aids — both programs are included on this month's cover CD.

VxIPConfig provides a basic troubleshooting kit, giving the IP address, subnet mask, default gateway and DHCP server. If your device hasn't been allocated a valid address, release the current address and get a new one using its renew function. VxUtil comes complete with port scanner, ping tool and the ability to do a ping sweep, looking for devices within an IP address range.

KEEP IT SIMPLE

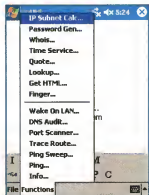

The Pocket PC's network authentication settings need to be amended if WEP is enabled. Go to Start > Settings > Connections > Advanced > Network Card and select your wireless connection. Next, open the Network Key section, choose the same Authentication Type as your router and enter the key.

Enable security features such as ICMP blocking, disabling SSID broadcast or MAC address filtering one at a time, resetting both the router and Pocket PC as you turn each on. That way, you know which change to reverse if connectivity is broken.

Once connected, you can surf the Internet from your Pocket PC and use Activesync to synchronise your PIM data via your LAN. **BTW**

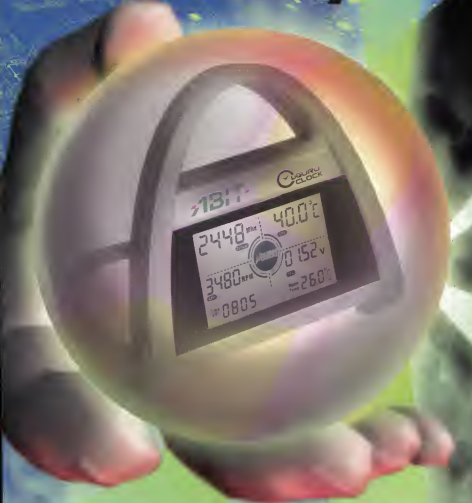

Network lowdown: getting an address is the first step in troubleshooting a network connection.

Utility belt: vxUtil provides a comprehensive set of tools for troubleshooting connections.

The 3rd Eye...

- Monitor critical system information
- System temperatures, voltages and fan speeds
- On-the-fly overlocking
- Email and MSN notification
- Zero CPU Utilisation
- System power on/off
- Available with ABIT AV8, AG8 and AA8-DuraMAX!

...see what others can't

ABIT's legendary reputation for innovation in the enthusiast PC market has reached new heights, with the release of the new 3rd Eye. Utilising ABIT's **µGuru** technology, the 3rd Eye allows you to effortlessly monitor and make active adjustments on such vital system statistics and settings as CPU frequency, preset overlocking levels, fan speeds and hardware voltages - via a remote LCD display, without any interruption to your programs!

3rd Eye can even alert you of incoming emails and MSN messages!

ABIT's 3rd Eye is available with all ABIT AA8-DuraMAX, AG8 and AV8 motherboards. www.abit.com.tw

3 MOBILE BROADBAND

WHAT YOU PAY FOR YOUR CARD \$0 NETCONNECT CARD

\$0* on a \$49 per month plan with \$49 of included Mobile Broadband.

*When you connect for 24 months. Total minimum cost over 24 months is \$1,176. If service is disconnected within 24 months \$25 a month for remaining months of contract term is payable. Included Mobile Broadband does not include usage while roaming on GPRS in 3's Video & Messaging Zones. Unused included Mobile Broadband usage expires each month. Hot for 3 plan applies to use of a NetConnect Card USIM in a 3 mobile. Your service may be disconnected if your USIM is used with other devices.

FAST EMAIL ON THE ROAD

- The NetConnect Card gives you mobile broadband connection in 3's Video Zones.
- Wireless access to email, Internet and corporate databases when in 3's Video and Messaging Zones.
- Send SMS messages from your notebook to multiple recipients.

\$99 MOBILE BROADBAND CAP

The \$99 Mobile Broadband Cap gives you up to \$500 worth of Mobile Broadband usage for \$99 per month, and includes a low rate of 0.1c/KB for Mobile Broadband use in 3's Video Zones.*

INCLUDED IN THE PACK

- 1 x NetConnect Card,
- 1 x CD (Modem Manager Software with User Guide),
- 1 x Protective Leather Wallet

3 Mobile Internet is a clear winner.

At up to 384kbps' downloads can be six times faster than a dial up landline* and nine times faster than GPRS

*Standard charges payable after \$500. Mobile Internet usage while roaming on GPRS in 3's Video & Messaging Zones will be charged at 0.4c/KB and is not included in the Cap or within included usage. *Download speeds of up to 384kbps are attainable in 3's Video Zones and download speeds of up to 40kbps are attainable in 3's Messaging Zones. The speed of the NetConnect Card will vary according to the zone you are in. Actual user speed may vary depending on a number of factors including location, network usage, equipment and applications used and worldwide Internet performance. *Comparison with 56kbps dial up modem.

3 MOBILE SOLUTIONS CAN ONLY BE PURCHASED VIA PHONE OR WEB FOR DELIVERY ONLY

WHAT IS THE WEBSMART SWITCH?

The WebSmart switch provides manageability at the price of an unmanaged switch.

What the WebSmart Switch provides:

- Web based configuration
- Port based VLAN
- Port trunking
- Port based QoS
- Port mirroring
- Port setting for speed, duplex mode or status of flow control. Auto-discovery utility will find all D-link Web Smart Switches on the network. Ideal for the small office that requires the ability to make changes to their network without the requirement of a fully manageable switch.

NETCOMM LOAD BALANCING ROUTER

NB740

BOOST INTERNET PERFORMANCE AND RELIABILITY WITH DUAL ISP CONNECTIONS

The NetComm NB740 Load Balancing Router combines the performance of two broadband connections in a single, easy to manage network gateway. Along with gateway security, the NetComm NB740 allows you to determine how your Internet traffic is shared or it can automatically balance the load according to bandwidth usage levels. The NB740 also offers a level of redundancy through the use of two WAN connections from different ISPs. Should one connection drop out, the NB740 can maintain Internet services by automatically routing data to the active connection.

CORDLESS AND OPTICAL COMBINATIONS

LOGITECH CORDLESS OPTICAL MOUSE BLACK

Enjoy freedom from snagged and tangled mouse cords with the Logitech Cordless Optical Mouse. Setup is a breeze - just plug the receiver into your PC or Mac and you'll be ready to go. The receiver can be hidden out of site, and its reliable cordless technology works within a 2 metre range so you're free to move about your desk. This mouse also features smooth optical tracking, a convenient scroll wheel, and Logitech's proprietary power management technology for extended battery life. It's all wrapped up in a smooth and comfortable design.

41387 **\$50**

LOGITECH CORDLESS MOUSE COLOUR SELECT

Go cordless the colorful way with the Logitech® Cordless Optical Mouse Color Select. With its changeable anodized red, metallic blue, and bright silver covers, you can personalise your mouse to fit your style. Setting it up is easy - just plug the receiver into your PC or Mac and you're ready to go. Its reliable wireless technology works within a 6 foot range so you're free to move about your desk. Image for illustration purposes only

P6518 **\$50**

HP PRINTADVANTAGE PUTS YOUR PRINT NETWORK ON AUTO-PILOT

SIT BACK AND RELAX AS HP PRINTADVANTAGE PUTS YOUR BUSINESS IN TOUCH WITH THE LATEST PRINTING TECHNOLOGY.

Replacing the conventional pay-per-page system, HP PrintAdvantage now integrates all of your printing costs under one fixed monthly payment. This fee covers everything from hardware and supplies to personalised service. But the benefits are far from just financial. HP PrintAdvantage offers toner delivery next day and worry-free printing with an upgraded 3 year warranty. So let HP PrintAdvantage take control of your print network and enjoy simple, cost-effective printing that lets you get on with the jobs that really count.

To find out more call Harris Technology on 1300 788 950 to speak to our sales team or log on to hpprintadvantage.ht.com.au.

- PCL 6 and Postscript 3 emulation
- 64MB built-in memory, expandable to 448MB
- 350 sheet input capacity

N9299 RENT ONLY/PER MONTH† \$399.43

Terms and Conditions:

Based on 36-month finance agreement by an independent rental company (Rentsmart), terms and conditions apply.

*Covers hardware, support, services and supplies. Total cost based on 3 year rental: \$4,512.22. Supplies include 16 toner cartridges which cover 500 printed pages per month with 20% coverage.

†Covers hardware installation, support, services and supplies. Total cost based on 3 year rental: \$11,370.93. Supplies include 36 toner cartridges which cover 1250 printed pages per month with 20% coverage.

Please note supplies excludes paper. Financing provided by an independent third party and is subject to approval and availability. Above rates are based on a 36-month financing term, excludes delivery charges. Installments are payable weekly or monthly in advance. Actual weekly or monthly payments depend on the exact system selected, term of financing and then applicable rates. Down payment and other credit enhancements may apply. Rates are subject to change without notice. Other terms and conditions apply.

For Finance enquiries, please contact 1300 855 631.

PLEASE NOTE:

All purchases subject to terms & conditions and returns policy. Delivery charges may apply. Not all items stocked in store but available for pick-up/delivery.

MAXTOR ONETOUCH™ - SMART STORAGE WITH PUSH-BUTTON BACKUP

ONETOUCH™ SERIES

The Maxtor OneTouch™ drive just press the button and your files are backed up in one simple step. It's simply the faster backup. Faster than CD. Faster than a floppy. Faster than removable cartridge systems. Space for your photos, videos, graphics, music, documents and more. It connects to FireWire or USB ports on a PC or MAC. It backs up with the Maxtor OneTouch™ button or runs automated backups using the included software, Dantz® Retrospect® Express. And you can customise the button to launch any application. Powerful, yet simple backup. Fast, flexible, huge capacity.

QUICK AND EASY INSTALLATION

- 1 INSTALL THE SOFTWARE
- 2 PLUG IN THE DRIVE
- 3 PUSH THE BUTTON AND FOLLOW ON-SCREEN DIRECTIONS

LE

WRITING SPEED DVD-R / DVD+R

4X
DOUBLE
LAYER

DVR-A08XL MAIN FEATURES:

- Industry leading speeds of 16x with DVD R and 4x with DVD+R DL:**
The DVR-A08XL records at a high-speed 16x with DVD±R media, and 4x with double layer DVD+R media. RAM media can also be read.
(Writing at 16x on 8x media is only possible with firmware supported verified 8x media)
- Precision recording technology:**
Pioneer's exclusive performance enhancing features ensure high quality recording characteristics and low operational noise.
- Smart Laser Driver:**
Write strategy control circuitry positioned in close proximity to the writing laser limits signal delay, allowing high quality recording at high speed.
- Liquid Crystal Tilt / Thickness Compensator:**
Provides accurate, reliable READ/WRITE performance with a variety of disc characteristics. The Liquid Crystal Compensator is an ideal solution for irregularly curved, thin/thick, and double layer discs.
- Performance Adjusting Firmware:**
Automatically adjusts between Performance mode and Quiet mode. Achieves an ideal solution by lowering disc rotation for quieter drive performance during DVD Video and Audio CD playback, while speeding up for high performance when required.

MYOB BUSINESS BASICS

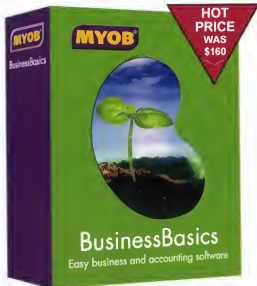

JUST INVOICES

YOUR EASY INVOICING SOLUTION

If you are looking for a better way to prepare your invoices, track your sales and calculate GST received, but you're not after a complete business management system, MYOB JustInvoices is just what you need.

SUITABLE FOR

- Tradespeople
- Consultants and contractors
- Online service providers
- Subscription-based service providers
- Cash-based businesses
- And any business that needs an easy invoicing solution

You've probably been running some of your business on computer already - keeping track of income, expenses and GST in a spreadsheet, or issuing your tax invoices from a word processing program. BusinessBasics brings all of your basic business functions together in one easy-to-understand application.

MYOB BusinessBasics simplifies the way you quote, track and invoice your jobs, simultaneously tracking your transactions and GST, and providing you with 70 reports and graphs to help you understand your business.

MYOB BusinessBasics also makes it easy for you to report your tax liabilities when you need to. The range of reports will help you identify your GST obligations, track GST paid and collected, as well as identify any transactions that you might have missed.

MYOB BusinessBasics lets you customise the content and look of reports to suit the needs of your business. For instance, you can limit the information a report contains to a particular period, account or customer, or include specific details such as a customer's credit limit.

CLIENT AND SERVER EXTENSIBILITY

JavaScript and XML client extensibility layer allows wide-ranging user interface customisation while web services notifications allow server-side extensibility.

MACROMEDIA® CONTRIBUTE 3

Macromedia® Contribute 3 redefines web publishing, making it an activity open to everybody, everyday. This release meets the full spectrum of needs for business users, web professionals, and IT decision makers. As a key element of the new enterprise-ready, scalable Macromedia Web Publishing System, Contribute 3 lets everyone in an organisation publish to websites and bring them alive with up-to-date content and information. Now, corporations can communicate internally via intranets or externally through marketing websites, government agencies can publish policies and procedures to their stakeholders, and educational institutions can implement campus-wide e-learning and academic intranets.

WEB PUBLISHING SYSTEM

harristechnology

Software

INTRODUCING MACROMEDIA WEB PUBLISHING SYSTEM

EVERYTHING AN ORGANISATION NEEDS TO AFFORDABLY BUILD, MANAGE, AND PUBLISH TO WEBSITES.

The Macromedia Web Publishing System is a scalable solution for organisations to affordably build, manage, and publish to websites. It provides a practical alternative to traditional content management systems, or complements existing systems by extending their value throughout an organisation. The Web Publishing System meets the needs of web developers, IT managers, and business professionals-empowering users to publish easily to the web within a centrally controlled, standards-based environment.

KEY MACROMEDIA WEB PUBLISHING BENEFITS:

EASY TO USE

The Web Publishing System makes building, managing, and publishing to websites straightforward and approachable.

- Business professionals easily update and publish web content
- Web professionals design and build websites using preferred tools
- Web and IT administrators centrally manage the entire system

AFFORDABLE

The Web Publishing System is an open and affordable solution that allows web content updates to be easily distributed throughout an organisation without requiring new infrastructure. Purchase only what you need now, and then add additional licences as required.

COMPATIBLE WITH EXISTING SYSTEMS

The Web Publishing System is compatible with existing web and IT infrastructure and works cross-platform. It also extends existing content management and learning management systems.

SCALABLE AND ENTERPRISE READY

The Web Publishing System is a scalable, extensible solution for enterprises that can be easily deployed across an entire organisation. It offers comprehensive support for web and IT standards, and new server-based central management of site connections and access permissions.

ENHANCE THE VALUE OF WEBSITES

Communicate more efficiently while presenting only the most up-to-date information to customers, employees, and partners. Finally business users and web professionals can work together efficiently, removing bottlenecks and bringing websites alive with content and communications

BUILD
Web developers increase productivity building advanced, easily maintained websites.

MANAGE
Web and IT managers unlock the value of enterprise websites for internal and external communications.

PUBLISH
Business professionals become directly involved in web publishing, bringing websites alive with up-to-date content and communications.

DRIVE IMAGE® V7- NOW FROM SYMANTEC

Drive Image® 7.0 Backup is a premier computer backup solution, protecting all your valuable data and providing peace of mind. Easily backup everything on your computer: priceless digital photos, important financial records, your operating system and all of your important programs and settings without ever leaving Windows®. Save valuable time by scheduling automatic backups. Quickly save your backups to virtually any writable CD or DVD drive and enjoy the flexibility of USB, FireWire® and Native Network support.

J6620 SINGLE USER
\$89

NORTON PARTITIONMAGIC™ 8.0

Lets you easily organise your hard drive to store data more safely and efficiently. Easy-to-use wizards help you create separate areas for your operating system, applications, documents, music, photos, games, and backup files. Disk partitioning reduces the risk of data loss if your system crashes, and each partition works just like a separate hard drive. You can resize, copy or merge partitions whenever you need. Supports both Windows® and Linux® file systems, and is a great way to run different operating systems on the same PC.

CREATE! 2

SCANSOFT PDF CONVERTER 2.0
PROFESSIONAL

A bundle of ScanSoft PDF Create! and PDF Converter Professional 2 significantly improves office productivity by providing business professionals with the ability to more seamlessly move between the two dominant electronic document formats - Microsoft Word and PDF. With PDF Converter Professional, organisations now have access to an industry-leading PDF solution that has the price, performance and features that can put the power of PDF on every business desktop.

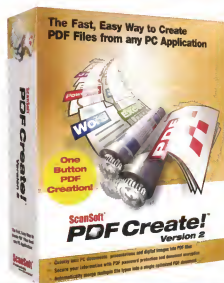

PDF Converter 2 contains powerful new features that allow you to quickly convert proposals, contracts, letters and more into Microsoft Word documents for editing, saving you valuable time and money.

PDF Converter can be used to extract charts and graphs from PDF files so they can be reused with Microsoft PowerPoint® and other applications with cut-and-paste ease. You can also turn static PDF forms into editable Microsoft Word forms with a single mouse click. Then convert all of your PC documents into industry-standard PDF files using the PDF Create! 2 software included with PDF Converter 2 Professional (see below for further details of PDF Create! 2).

SCANSOFT PDF CREATE! 2

ScanSoft PDF Create! is the fast, reliable and affordable way to turn all of your PC documents, drawings and images into industry-standard PDF files. Now you can instantly create PDF documents that are compact and easy to e-mail, can be universally viewed on the Web and that print just as if they came from the original application. PDF Create! also gives you all of the advanced features you need, including compatibility with all PDF file types (even new 1.5), compressed file size, password security, 128-bit encryption, batch conversion of multiple files at a time, watermarks, bookmarks, hyperlinks and more. PDF Create! is compatible with ScanSoft PaperPort® Pro Office, Adobe® Acrobat® and Reader, as well as other PDF viewing or editing applications.

WHY YOU NEED PDF CREATE!

- Share documents for universal viewing
- Secure documents with password/encryption
- Create smaller size files for e-mail/ftp
- Restrict editing of shared documents
- Save Web pages and e-mails as searchable PDF files
- Cost-effective alternative to Adobe® Acrobat®

WHAT TODAY'S CAD DESIGNERS WANT

AUTOCAD® 2005

Creating a single drawing as efficiently as possible is important. Delivering a coordinated set of drawings in a timely manner directly benefits your bottom line. With AutoCAD 2005 you can do both. Everyday tools like the table object and tool palettes boost productivity, and the new Sheet Set Manager helps you control content across entire sets of related drawings, enabling you to lower the risk for errors. Then, in a single view, you can compose and collate sheet sets and share them with your project team using plots, eTransmit, or DWF™ (Design Web Format™) files.

N0571

\$5,999

AUTOCAD LT® 2005

With AutoCAD LT 2005 you can easily create, plot, publish, and share your 2D designs. You get more done in fewer steps with a streamlined plotting interface and drafting features that boost your productivity. Quickly create tables, better manage large groups of layers, and conveniently access frequently used content to work more efficiently. Sharing your data widely is a snap: even team members without AutoCAD LT software can view and mark up your published DWF™ files, and you can instantly distribute multiple DWG files in a single step. Plus background plotting frees you to work while you print out your drawings.

Internet Security & Acceleration Server 2004

harristechnology

Software

MICROSOFT® ISA SERVER

Attacks against IT networks are on the rise and becoming increasingly complex. Traditional firewalls are often inadequate to protect today's Internet-connected organisations from these attacks, potentially exposing you to business and legal risks.

INTRODUCING MICROSOFT INTERNET SECURITY AND ACCELERATION (ISA) SERVER 2004 STANDARD EDITION (SE)

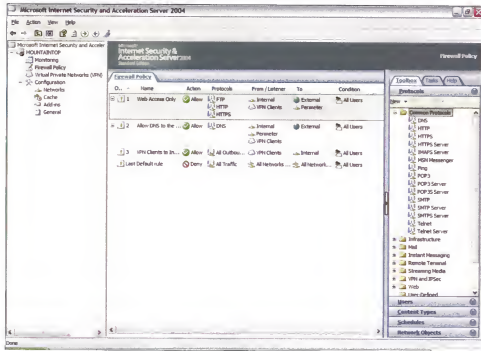

The next-generation application-layer firewall, VPN, and Web-cache solution from Microsoft that enables you to easily maximise your existing IT investments in order to improve network security and performance.

ISA Server 2004 SE is an ideal integrated solution for small- to medium-size organisations and branch offices, and is perfect for enterprises as an in-line firewall to protect key business applications.

can help you:
Securely share information with employees, customers, and partners.
Ensure your Microsoft applications such as Microsoft Exchange Server are protected and are easily accessible.
Control Internet access to improve employee productivity and thwart malicious attacks.
Improve the performance of your network.

HOW TO LICENCE ISA SERVER 2004

ISA Server is licenced on a per-processor model. One licence is required for each processor running on the server. Client access licences are required.

ADVANCED PROTECTION BUILT IN

ISA Server 2004 SE features an updated firewall architecture that has been specifically designed to combat the latest types of Internet attacks and worms. Ideally suited to protect and extend Microsoft solutions such as Exchange and Microsoft SharePoint® servers, ISA Server 2004 SE can help you control access to these resources and provide advanced multilayer security, including at the application layer.

FAST, SECURE ACCESS

ISA Server 2004 SE includes a greatly expanded array of tools and other features in order to enable secure VPN access to your network. Improved policy-based access control allows you to restrict incoming and outgoing access. And built-in Web caching optimises bandwidth usage and accelerates Web performance. ISA Server 2004 SE can also securely extend the availability of your Exchange Servers to remote users.

EASY TO USE

A member of the Microsoft Windows Server System™ family, Microsoft ISA Server 2004 SE has been designed to work seamlessly with existing Microsoft infrastructures and applications. It offers a new, simplified user interface that can make it easier for you to implement security policies and ensure proper configuration. ISA Server 2004 SE is easy to learn, leveraging your existing knowledge of Microsoft applications. ISA Server 2004 can be remotely managed, and you can keep abreast of network access and usage through detailed logging, reporting, and alerts. To learn more about Microsoft ISA Server 2004, please visit www.microsoft.com/isaserver.

PLEASE NOTE:

All purchases subject to terms & conditions and returns policy. Delivery charges may apply. Not all items stocked in store but available for pick-up/delivery.

MICROSOFT OFFICE FRONTPAGE 2003

OTHER NEW FEATURES IN FRONTPAGE 2003

BEHAVIORS

Use behaviors to author client-side Netscape JavaScript or Microsoft JScript® without writing a single line of code.

FLASH SUPPORT

Update and enhance your site by adding Macromedia Flash content, including movies, audio-enhanced animations, and previously recorded presentations or courses.

IMAGE TRACING

Mock up an image of a Web page in a graphics program and then use it as a visual guide to create or trace the Web page design in FrontPage.

INTERACTIVE BUTTONS

Select and add professional-looking buttons to your site. Choose the font and button colour, define a link, and then set image and text settings for original, hover, and pressed states.

PAGE RULERS AND LAYOUT GRID

Precision design and placement are easy with helpful positioning guides, such as page rulers and the background layout grid.

TABLES AND CELLS LAYOUT

Create a framework for Web content using layout tables and cells. Automatically create professional graphic effects, such as rounded corners and shadows.

ASP.NET CONTROLS

Use FrontPage 2003 to preview Microsoft ASP.NET controls and work with Microsoft Visual Studio®

SPLIT VIEW

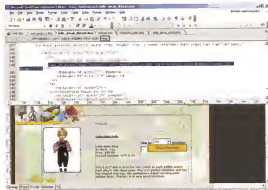

Review and modify content in a split-screen format that offers simultaneous access to Code and Design views.

TYPING AIDS

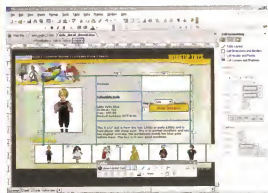

Speed up the code-writing process by using wordwrap, line numbers, automatic indentation, tag completion, bookmarks, and advanced code selection.

PLEASE NOTE:

All purchases subject to terms & conditions and returns policy. Delivery charges may apply. Not all items stocked in store but available for pick-up/delivery.

When using the Split View, edits made in the Design window automatically update Code window.

Achieve the design you want using the Cell Formatting Work Pane to manipulate columns, rows and cells.

*A minimum of 5 licences is required to start an Open Business Licence agreement. Media kit maybe required at additional cost.

HOW MICROSOFT FRONTPAGE 2003 HELPS YOU BUILD BETTER WEB SITES

Microsoft® Office FrontPage® 2003 is the Web site creation and management tool that gives you the features, flexibility and functionality to help you build better Web sites.

FrontPage delivers the professional design, authoring data, and publishing tools customers have asked for to create dynamic and sophisticated Web sites.

DESIGN WITH CONFIDENCE

- Improved graphics support makes it easier to work with graphics from other applications, giving you more control over how images are displayed and saved.
- Dynamic Web Templates let you designate which sections of the site can be edited. When updating the master template file, those changes are automatically made to all pages linked to that template.
- Browser and resolution reconciliation target specific browser or screen resolutions, or see how your site will look in various combinations of browsers and resolutions.
- Layout table tools make it simple to create and manipulate tables used for layout purposes, and provide pixel-precise control of your layout.
- Layer manipulation tools make it much easier to work with multiple images and pieces of content that all sit in the same space and to create visual effects, such as pop-up menus.

CODE EFFICIENTLY, FASTER CODING TOOLS

- Split view displays edits made in the Design view automatically updated in the Code view.
- Quick Tag Selector and Quick Tag Editor helps you easily select, edit, and manipulate tags.
- Microsoft IntelliSense® technology makes writing code (HTML, CSS, XSL, JScript, and ASP.NET) easier and less prone to errors.
- Clean HTML code removes extraneous code generated by Microsoft Word or other Web authoring programs.
- Code Snippets store chunks of code and insert them into other documents from a library of code snippets.

Comsol 2.2GB Minidrive

Store up to 2.2GB of data with this ultra compact 1 inch hard disk drive that plugs directly into your USB port. The Comsol Mini Drive works like a flash drive but provides greater storage capacity and durability. It requires no external power and operates under Windows ME/2000/XP and Mac without having to load any drivers or software.

Pioneer DVR-A08XL 16x DVD-R/R+

Pioneer launches its new multiple format DVD writer. The DVR-A08XL is the industry's first DVD writer to support 16x write speeds on both DVD-R/R+ along with the option to write at 4x speed on Double Layer media. This extends Pioneer's track record of establishing key performance benchmarks when introducing new DVD writers.

City Software is an Australian Government Endorsed Supplier.

City Software is proud to announce that we recently became an Australian Government Endorsed Supplier which provides pre-qualification for businesses in the Information Technology industry to sell to the Australian Government. As you may already know we have one of the largest stock holdings of business and educational products in Australia; so if you are a local, state or federal government department looking for a company that can professionally and timely serve all your IT needs look no further than City Software. Call our expert managed accounts team on 1300 761 761 today.

Rental Finance For Small Business.

With a RentSmart rental finance facility, you simply select the equipment you need from ISWH and/or City Software. RentSmart will buy the equipment and rent it back to you.

You'll benefit from tax deductible monthly payments which are good for your cashflow. And because you've rented rather than purchased outright, you'll always be free to update to new equipment when you need (Conditions apply).

Finance is available for hardware items over \$500 or where hardware represents 60% of the purchase value. Figures based on 36 month continuous term and include GST and stamp duty. RentSmart is available to approved customers on selected products. Terms and conditions subject to change without notice.

Join our SmartBuy Club now and discover the benefits of partnering with ISWH & City Software!

Benefits of the SmartBuy Club include:

- Reward certificate valued at 3% of purchase. This certificate may be redeemed against your next order at ISWH and City Software by either quoting the SmartBuy Club certificate number over the phone, quoting it on your next web order, or including it in your mail order.
- Special product promotions offered only to members.
- Updates of the latest quality news on the products you select to be informed on. Choose to be updated by email/web or mailer.

For full details and to apply online, visit www.csw.com.au/smartbuy.asp or call us on 1300 658 600. Apply now for the full benefits we have to offer! Purchases through both ISWH and City Software (including web orders) qualify for SmartBuy Club benefits.

Desktop PC Bundle
Websearch Code 214615**\$215****Belkin High-Speed Mode (125Mbps) Wireless G Desktop Network Card**

The Belkin High-Speed Mode (HSM) Wireless G Desktop Network Card connects your desktop computer to your wireless network.

- 35% faster than standard 802.11g
- Advanced security features WEP and WPA
- Complies with 802.11g standards, backward compatible with 802.11b

Call for Pricing

NetComm Load Balancing Bandwidth Aggregator (NB740)

The NB740 combines the performance of two broadband connections in a single, easy to manage network gateway. The NB740 determines how Internet traffic is shared or it can automatically balance the load according to bandwidth usage levels. It also offers redundancy through the use of two WAN connections from different ISPs. Should one connection drop out, the NB740 can maintain Internet services by routing data to the active connection.

Websearch Code 248104

\$433**NetComm ADSL Integrated Gateway wireless (NB5580W)**

Recommended by PC World due to its features and user-friendliness, the NB5580W is the only true all-in-one communications device available today. It features an integrated ADSL modem, 54Mbps Wireless Access Point, advanced Stateful Packet Inspection Firewall, multiple VPN end-points and a 4-port Ethernet Switch to share network services between wired and wireless clients.

Websearch Code 212694

\$297**Belkin Wireless 802.11g Print Server**

Easily add two USB printers to your wireless, or wired network. It features 802.11g technology that makes sending print jobs faster than ever, and includes a memory buffer that handles your graphics jobs effortlessly. Compatible with most USB, network-ready printers, and major operating systems.

**Belkin High-Speed Mode (125Mbps) Wireless G Notebook Network Card**

The Belkin High-Speed Mode (HSM) Wireless G Notebook Network Card connects your notebook computer to your wireless network.

- 35% faster than standard 802.11g
- Advanced security features WEP and WPA
- Complies with 802.11g standards, backward compatible with 802.11b

Call for Pricing

NetComm ADSL Ethernet/USB Modem Router (NB1300Plus4)

An enhanced version of NetComm's NB1300, the NB1300Plus4 provides affordable, high-speed, shared Internet access for home or office networks. It features an ADSL modem with USB and 10/100 Ethernet interfaces, a Router and a 4-port 10/100 Switch. Deployable in Bridge (modem), PPPoE, NAT Bridge, Router, NAT Router or NAPT Router modes, the NB1300Plus4 is compatible with all major operating systems.

D-Link 1-Port Print Server (DP-301P+)

Compared to software-based printer sharing, the DP-301P+ eliminates the need to have your printer connected to a host computer. With the DP-301P+, everyone on your network can be sure that their printing jobs go through at any time. Documents also print faster from the DP-301P+ than from software-based printer sharing solutions.

LaCie DVD±R/RW8x + Dual Layer DVD+R2.4x

Double Layer Technology

Store nearly twice as much data as current DVD media - 8.5GB on a single-sided DVD disc. Save up to 16 hours of VHS video, 4 hours of high-quality MPEG-2 DVD video or up to 8.5GB of data, audio or images. Large-capacity, double layer DVD media (DVD+R9) is also ideal for backing up computer systems or archiving MP3 libraries on a single disc.

DVD±R in One Drive

This universal drive delivers four DVD formats in a single, slim device. This combination drive is also capable of writing to CD and DVD formats, which are compatible with nearly all existing DVD-Video players.

Record Custom DVDs in Minutes

Offering the fastest DVD record speed on the market, the LaCie d2 DVD±RW Double Layer Drive features 8x record speeds in DVD-R and DVD+R formats. This all-in-one rewritable drive also features FireWire and Hi-Speed USB 2.0 ports for easy connection to any Mac or PC.

Pioneer DVR-A08XL 16x DVD-R/+R

Pioneer launches its new multiple format DVD writer. The DVR-A08XL is the industry's first DVD writer to support 16x write speeds on both DVD-R/+R along with the option to write at 4x speed on Double Layer media. This extends Pioneer's track record of establishing key performance benchmarks when introducing new DVD writers.

Features

Industry leading speeds of 16x with DVD-R/+R and 4x with DVD+R DL
The DVR-A08XL records at a high-speed 16x with DVD-R/+R media, and 4x with double layer DVD+R media. RAM media can also be read.

Precision recording technology

Pioneer's exclusive performance enhancing features ensure high quality recording characteristics and low operational noise.
Performance Adjusting Firmware: Automatically adjusts between Performance mode and Quiet mode. Achieves an ideal solution by lowering disc rotation for quieter drive performance during DVD Video and Audio CD playback, while speeding up for high performance when required.

Included Software:

- Ulead DVD Movie Factory 3.5 SE Suite
- Video Studio B SE
- DVD Workshop 2 SE
- Nero 6 (New)
- (all with AC-3 encoding)

Specifications

- Write:
- 16x DVD-R/+R (to certified BX media)
 - 4x DVD+R DL (to certified 24X dual layer media)
 - 4x DVD-RW/+RW
 - 32x CD-R
 - 32x CD-RW

Maxtor OneTouch Personal Storage

It's not just data, it's your life. Save it. Store it. Back it up with the push of a button.

Just press the button and your files are backed up in one simple step. It's simply the faster backup. Faster than CD. Faster than a floppy. Faster than removable cartridge systems. Need storage? We're talking huge amounts—up to 300GB. Space for your photos, videos, graphics, music, documents and more. Spend less time searching for files by storing them on a single, spacious drive.

The drive, with its high quality, anodized aluminum case, is as attractive as it is flexible. It's great for home or office. It lies flat on your desk or stands upright to save space. It connects to FireWire or USB ports on a PC or Mac. It backs up with the Maxtor OneTouch button or runs automated backups using the included software, Dantz Retrospect Express. And you can customize the button to launch any application.

120GB - Perfect for home or office

The Maxtor Personal Storage external hard drive quickly adds storage and organisational space through your computer's USB port.

200/250GB - Perfect for video editing and high-end graphics

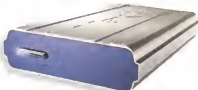

The Maxtor 7200RPM hard drive featuring both FireWire (IEEE1394, iLINK) and USB Interface ports for your PC and Mac.

300GB - Perfect for storage hungry files

The Maxtor 300GB hard drive provides you with enough capacity to hold and organise your storage-hungry applications and files.

Features

- Patent-pending Maxtor OneTouch technology
- Plug and play storage
- Hot-swappable
- Anodized aluminum design
- Stands vertically or horizontally
- Customisable Maxtor OneTouch button
- Power management and on/off switch
- Whisper-quiet FDB motor
- Mac formatted (for Mac)
- Connect additional drives

Belkin CoPilot Live PocketPC Edition

Connects wirelessly to your Pocket PC using the power of Bluetooth

Drive with confidence!

Travelling by road can be frustrating for anyone, with things like detours, delays, and losing your direction only makes things worse. Belkin CoPilot Live will handle those distractions so you can concentrate on what's important to you. It's the personal GPS navigation solution you can take anywhere.

Enter up to 50 different locations. Quickly and easily enter your journey and follow Belkin CoPilot's turn-by-turn spoken instructions.

Maintain peace of mind. Even if you miss a turn, hit traffic or encounter roadwork, you have nothing to worry about.

Always stay on track.

Within seconds Belkin CoPilot will automatically re-route you. You'll still get spoken directions all the way to your destination.

Kit also includes:

- Secure Digital Memory Card Pre-Loaded with Australian maps
- In-Vehicle Power Adapter for BT GPS and your Pocket PC
- Vent Mount

Apple iPod Mini

Apple engineers squeezed all the best features of iPod into a case weighing just 3.6 ounces and smaller than any cell phone. iPod mini features an anodized aluminium case that resists stains and scratches. Like its (slightly) bigger brother, iPod mini gives you over 25 minutes of skip protection and lasts up to 8 hours on a single battery charge. So you won't pay a penalty for miniaturization. Win/Mac

Comsol USB 2.0 Minidrive - 2.2GB

Store up to 2.2GB of data with this ultra compact 1 inch hard disk drive that plugs directly into your USB port. The Comsol Mini Drive works like a flash drive but provides greater storage capacity and durability. It requires no external power and operates under Windows ME/2000/XP and Mac without having to load any drivers or software.

The Mini Drive's large capacity yet compact and lightweight design make it the ideal portable storage device for large files such as MP3 or MPEG. It also comes with an instant Auto Zip function that compresses files to save disk space.

The email function stores your mail settings which allows you to use Outlook Express, from any computer, to access your email when you are travelling. The Mini Drive can also save your Internet Explorer Favourites, giving you access to your favourite sites from wherever you are.

- Compliant with USB specification 2.0 and Version 1.1
- PC Lock function prevents unauthorized access
- Fast 4200 RPM operation and power-saving mode
- Supports Windows 98SE/ME/2000/XP and Mac OS 8.6/9.0/1.0 and above
- Supports Linux 2.4/Red-Hat Linux 7.x and B.x

Autodesk AutoCAD LT 2005

Efficient, Secure, Affordable 2D CAD Software

AutoCAD LT 2005 is the affordable 2D CAD software that helps you create, plot, publish and share your 2D designs. You can quickly create tables, better manage large groups of layers and conveniently access frequently used content to work more efficiently. Sharing your data widely is a snap: even team members without AutoCAD LT software can view and mark up your published DWG files and you can instantly distribute multiple DWG files in a single step. Plus background plotting frees you to work while you print out your drawings. AutoCAD LT 2005 provides full DWG compatibility with AutoCAD 2005.

Autodesk AutoSketch 9

AutoSketch 9 software provides a comprehensive set of CAD tools for creating precision drawings—from electrical details to floor plans, from conceptual sketches to product specifications, and much more. Offers straightforward drafting in a Windows XP-like environment plus tutorials and wizards for a fast start.

Websearch Code... 248971

\$198**Autodesk Volo View 3**

Using Volo View 3, team members can view, mark up, measure, print, and plot AutoCAD 2004, Autodesk Inventor 7, and raster formats as well as DWG (Design Web Format) files without having the original design creation software. The files display and print exactly as the document creator intended—with rich design information, such as layers, views, and measurements.

Websearch Code... 208029

\$299**Autodesk AutoCAD 2005**

Faster Data Creation, Easier Data Sharing

Creating a single drawing as efficiently as possible is important. Delivering a coordinated set of drawings in a timely manner directly benefits your bottom line. With AutoCAD 2005 you can do both. Everyday tools like the table object and tool palettes boost productivity, and the new Sheet Set Manager helps you control content across entire sets of related drawings, enabling you to lower the risk for errors. Then, in a single view, you can compose and collate sheet sets and share them with your project team using plots, eTransmit, or DWG (Design Web Format) files.

Why get MS Office 2003?

Microsoft Office 2003 Editions deliver significant improvements over previous versions of Office, including:

- Advanced e-mail management tools to help you fight back against spam and viruses better than ever before.
- Improved automatic document recovery and compatibility with older files, which mean fewer worries about lost data.
- Brand-new collaboration features to allow you to share work easily and stay connected anytime, anywhere.

MS Office 2003 Editions work best with Windows XP

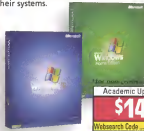

- If you use Windows XP or Windows 2000, then Office 2003 is the right choice for you.
- If you use Windows 98 or Windows Me, you should consider upgrading to Windows XP.
- If upgrading to Windows XP is not an option for you, then Office XP is the best way to go.

Microsoft Windows XP Home

Windows XP Home Edition is an excellent choice for most home users, with exciting new features that help you do more with your computer.

Microsoft Windows XP Professional

Windows XP Professional provides the highest levels of performance, productivity and security. It is the best choice for business users and for home users who demand the most from their systems.

TypeSmart

TypeSmart can take beginner or "hunt and peck" typists to 10 finger touch typing in just 6 hours.

TypeSmart justifies its tagline "Breakthrough Typing Tutor" by dispensing with the outdated Home Keys method and introducing the eText Direct Reach Method recommended by the latest research into modern typing. It is the only typing software to do so and is now established in many of Australia's leading private schools, Australia's largest provider of distance learning, Deakin University, and is now being actively promoted into the TAFE and training environments.

Mobilise your business with Pendulum for Pocket PC

Quickly and easily create your own applications for Pocket PC PDAs

- ◆ time/expense recording
- ◆ remote order taking
- ◆ fleet management
- ◆ van sales
- ◆ field engineers
- ◆ asset tracking
- ◆ stock control
- ◆ market research
- ◆ delivery tracking

More and more businesses are discovering the benefits of using handheld computers and PDAs to capture data and enable data processing to be done 'out and about'. Pendulum enables you to quickly and easily create your own mobile applications for Pocket PC based handhelds. Pendulum is not a programming language, it's a user-friendly graphical style application creation system - you don't need to be a programmer to use it. Contact us on **1800 737 660** for further details about developing your own mobile data solutions with Pendulum development software.

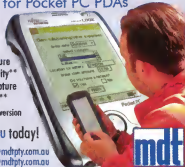

- ◆ text/number input
- ◆ barcode input/data capture
- ◆ RF wireless comms capability**
- ◆ signature and drawing capture
- ◆ ODBC database linking**

**Pendulum 'Application Builder' version

*Try Pendulum for **FREE** - download entry level 'Data Collector' version from www.mdtply.com.au today!

Downtime

High-performance playtime

lounge room tech

Couch potato

A plasma TV is the ultimate, but beyond the reach of most. Dan Warne reckons that a wide-screen LCD is the perfect compromise.

Samsung LS32A33W 76cm

Samsung's LCD TVs are just as good as its monitors. The high-definition picture quality is brilliant, with lightning fast 16ms pixel latency. The DVI connection allows you to connect your PC as well, making the \$6,000 price tag easier to justify. Two tuners provide picture-in-picture capability (though they're only analog). Onboard Dolby Digital and DTS decoding gives you direct surround sound outputs without needing an AV amplifier, and the TV has three meaty built-in JBL 15W speakers and subwoofer output.

▲ **Upsides:** DVI, dual-tuners, two-year warranty.

▼ **Downsides:** no memory-card reader. No zero dead pixel guarantee.

Details

Online www.samsung.com.au

Price \$5,999

Verdict ★★★★★

Xwires

Wireless won't make you play better.

If your neck's locked up from swivelling your head across the big screen while gaming, getting away from the action is the answer with the Wideye-Microgram XC1 Wireless Xbox Controller.

It's somewhere between the original and S-type controllers in size, but the tall thumbstick may make it tricky for little fingers. Batteries last 50 hours, it can maintain control up to 10 metres from the screen and it has an inbuilt vibration feedback motor.

Xbox Live! hasn't been ignored either. An add-on XA1 audio communicator is currently on sale in the US, but is still awaiting approval for sale in Australia.

Sharp Aquos 66cm LC26GA3X

▲ **Upsides:** 800:1 contrast ratio for rich blacks. Allows the capture of TV to MPEG-4 format using PCMCIA hard drive or an optional memory card reader. Three-year warranty.

▼ **Downsides:** dead pixel warranty claims are done on a case-by-case basis. No DVI input. No surround sound decoding. Speakers are only 2.1W per channel (4.1W total).

Panasonic Viera 66cm wide-screen LCD TV TX26LX1A

▲ **Upsides:** SD and PCMCIA memory card slot for display of pictures. Lots of inputs — four composite, three S-Video and one component. Snappy 16ms response time.

▼ **Downsides:** the built-in speakers are only 10W each. No DVI input, no surround sound decoding, one-year warranty, 500:1 contrast could be better. Only one analog tuner.

Details

Online www.panasonic.com.au

Price \$5,499

Verdict ★★★★★

Sony 66cm wide-screen LCD WEGA KLV26HG2

▲ **Upsides:** Zero dead pixel warranty once registered.

▼ **Downsides:** No built-in tuner. No DVI line input, so you can't connect your PC or HD box digitally. Only reads Sony's proprietary Memory Stick (standard and pro) formats for photo and MPEG playback. One-year warranty is worrying for a TV. Built-in speakers are a measly 4W each.

Grab hold and burn rubber

Opening a beer and settling in behind the wheel for some fast driving is the ultimate thrill. But only in the safety of your home, of course. *Nick Race* takes three rival steering wheels for a spin.

Thrustmaster Ferrari F1

▲ **Upsides:** the mix of shiny red box, carbon fibre and aluminium wheel and chequer plate pedals make this as close as you'll get to a real Ferrari on your PC. The force feedback has more grunt than a pig farm.
▼ **Downsides:** at \$300, you gotta

love your driving games. With all the unmarked buttons, it'd be easier driving the real thing.

Details

Price \$299
Verdict ★★★★★

Details

Online <http://au.thrustmaster.com>
Price \$179.95
Verdict ★★★★★

Thrustmaster Enzo Ferrari

▲ **Upsides:** the force feedback will give you arm muscles that would make Popeye jealous.
▼ **Downsides:** feels cheap due to the plethora of plastic, and the faux carbon fibre finish on the wheel won't impress anyone. You'll be chasing the pedals across the floor if you use it on carpet.

Details

Online www.logitech.com
Price \$199.95
Verdict ★★★★★

Logitech MOMO Racing

▲ **Upsides:** the rubber wheel is easy to grip — even in the most sweaty-palmed race. Well built, so a fit of road rage shouldn't see bits of plastic flying around the lounge room.
▼ **Downsides:** it's noisy and the pedals are too close together, so playing in socks is a must. But do you really want to smell your mates' feet?

Snoop doggy lock

If you've witnessed the consequences of workplace practical jokes involving someone using a co-worker's email address, the LASER Wireless PC Lock will provide peace of mind. It's a USB key, wireless medallion and software combo which locks your computer if you move more than two metres away from it. Come back within range and it unlocks. If you leave the medallion at home you can unlock your PC with a password.

Verdict ★★★★★

Cool your cockles

Computer makers adopted "notebooks" over "laptops" because high-spec models generate groin-grilling amounts of heat. *Dan Waine* checks out two lap savers.

Karabri Lap ramp

▲ **Upsides:** simple and inexpensive, it's a piece of moulded plastic that lifts the computer away from your lap. Large cut-out areas ensure there's ventilation for both your laptop and legs. Rubber strips grip your notebook securely.

▼ **Downsides:** passive cooling only. It would be better if it were collapsible for flat storage in a laptop bag.

Details

Online www.lapramp.com.au
Price \$25
Verdict ★★★★★

Cooler Master CoolPad

▲ **Upsides:** two USB-powered fans keep your notebook way cooler than normal — in fact your lap may get a bit chilly from the constant airflow. Aluminium construction picks up heat from the notebook and conducts it away very effectively.

▼ **Downsides:** saps notebook battery life. The small ridge at the front of the pad isn't large enough to stop a notebook from slipping off. Relatively expensive.

Details

Online www.australait.com.au
Price \$66
Verdict ★★★★★

Shooting spree

There are places — the bush, the beach, the Bronx — where you want to take photos but don't want to take a \$2,000 digital camera. Nick Race looks at three high quality sub-\$500 alternatives.

Canon PowerShot A75

▲ **Upsides:** easy to use, and the results look great for a 3.2 megapixel camera. Plenty of vibrant colour; you'll think you're in the Bahamas!

▼ **Downsides:** movie mode isn't crash hot, and you'll be lucky to get 90 seconds on the supplied 32MB CF card.

Details

Online www.canon.com.au

Price \$449

Verdict ★★★★★

Sony Cyber-shot DSC-P43

▲ **Upsides:** it's small enough to lose in a pocket full of change. Clear pics and MPEG movies will delight friends and family on "slide night".

▼ **Downsides:** images stored on Memory Stick. Degree in Cyber-shot operation required. Power button hard to find in a hurry for those "candid" snaps.

Details

Online www.sony.com.au

Price \$449

Verdict ★★★★★

Kodak EasyShare CX7530

▲ **Upsides:** large, bright LCD screen for framing the right shot. Five megapixel CCD means huge resolution for blowing up on a printer. Slot it into the optional extra \$299 Kodak EasyShare printer dock for terrific 10 x 15cm photo prints produced using dye-sublimation technology. Also charges in the dock.

▼ **Downsides:** takes what seems like an age to store a picture once it's "clicked".

Details

Online www.kodak.com.au

Price \$499

Verdict ★★★★★

Dorkslayer

Most Bluetooth headsets make you look half cyborg, half wanker. Not this one.

The Wideye BP100 Bluetooth Pendant Headset hangs around your neck, so you can conceal the electronics under your shirt. All anyone will see is a secret service-style headphone running to your ear. Of course, if you still want to "be seen" with your Bluetooth headset, you can hang around in lobbies saying things like "Eagle is on the move".

The Wideye worked a treat with our Sony Ericsson T610 test phone. But a word of warning: the rechargeable battery is difficult to insert and you've no hope of pairing it with your phone if you don't read the manual. And it ain't cheap — at \$199, the old cyborg-style headsets may still appeal.

Details

Online www.microgram.com.au

Price \$199

Verdict ★★★★★

More pixel for your pleasure

Mobile phones are moving out of the realm of blurry, VGA-quality pictures and into high resolution camera territory. Peter Curtis pits two against each other.

Sharp GX30

▲ **Upsides:** extensive photo manipulation features (image rotation, framing and a range of filters). Digital zoom. Includes an 8MB Secure Digital memory card. Bluetooth compatible.

▼ **Downsides:** weak quality shots. Resolution is not quite a megapixel (1,144 x 858). PC software only synchronises contacts with Outlook or Outlook Express. No calendar or task sync. Bluetooth doesn't work for PC sync; only connects to a PC via an optional USB cable. The multi-coloured disco flash effect is cool in theory, but can't be combined with MP3 playback.

Details

Online www.vodafone.com.au

Price \$899

Verdict ★★★★★

Nokia 7610

▲ **Upsides:** photo quality is surprisingly good, with slightly higher resolution (1,152 x 864) than the Sharp. Symbian OS provides basic functionality to adjust brightness, contrast and apply filters. Image Converter PC software converts images from a variety of formats, allowing you to zoom, flip, rotate, crop, emboss, motion blur, colourise and so on. Cropping feature offers presets such as portrait, MMS Picture and wallpaper. The supplied PC sync software is powerful and refined. Internal antenna.

▼ **Downsides:** sluggish menu response. "Quirky" keypad design. Looks like something you'd buy in the canned fish section of the supermarket.

Verdict ★★★★★

Pushing all your buttons

iPods as universal remote controls? It can be done, writes Dan Warne.

Glad it's wrapped

First-time owners learn the hard way that the iPod's polished metal back and shiny polycarbonate face scratch very easily. Even Apple's svelte nylon case scratches the iPod as it's slipped in and out. One simple but ingenious solution is a form-cut piece of clear, flexible acrylic which "wraps" the iPod and clings by static electricity. Your iPod's buttons continue to work through the wrap and your 'Pod will still fit into Apple's nylon case when wrapped up.

Details

Online www.jrhillandcompany.com

Verdict ★★★★★

All-in-one iPDA

Every once in a while software appears that is just disgustingly good. iPod Agent is one such program, transferring Outlook mail, appointments, contacts, tasks and notes to your iPod. It also grabs weather forecasts, RSS news feeds, and can automatically download Australian movie times and puts them into your 'Pod.

Details

Online www.ipodsoft.com/ipodagent.aspx

Price Free

Verdict ★★★★★

iPods may be designed to do one thing and do it well, but gadget fans are working their lateral thinking lobes overtime to squeeze unimaginable functionality out of their 'Pods.

The popular gadget blog engadget (<http://engadget.com>) has discovered a trick whereby infra-red signals from remote controls can be "recorded" as sound and played back from the iPod as infra-red again. The idea is that you can record the signals produced by the buttons on your various remote controls and then control all your devices — TV, set-top box, stereo and so on — from your iPod. As long as you don't mind doing it all with the iPod's scroll-wheel, that is.

The engadget crew says it has a TV, DVD player, satellite TV receiver, hard drive TV recorder, media centre PC, Xbox, satellite radio tuner and even a robot under the control of the iPod. Using an ingenious bi-directional sound-to-infra-red converter from Griffin that looks something like a satellite phone antenna, the "Total Remote" hack was originally designed to allow its owners to use PDAs as universal remote controls.

The tricky part is getting the infra-red signals recorded as sound in the first place. You need to get your hands on a Windows Mobile-based PDA, plug in the Total Remote and record the infra-red signals from your regular remote into the PDA. These sound files are then recorded to

a PC, and from there to the iPod via iTunes. The infra-red "sound recordings", which can be set up in a playlist for easy access, are stored as individual music tracks on the iPod. When played, the Total Remote converts them back to an infra-red signal Griffin claims is "way stronger" than a normal remote and can control a device up to 30m away.

We can't help wondering how long will it be before "remote control sound recordings for 22in Sony WEGA KV-36FV27" start popping up on SuprNova (<http://suprnova.org>).

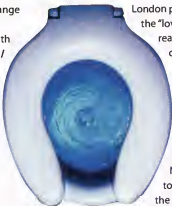

The Griffin Total Remote can be purchased from eXpansys (www.expansys.com.au) for \$62.95 or ordered directly from US-based Web sites for as little as US\$13. Go to www.apcmag.com/info/iPodremote for a full tutorial.

Pundits are tipping that Griffin will now release a version of Total Remote specifically for the iPod. It had planned the release of such a device under the moniker PodMate, but development was cancelled before it was brought to market.

Flush with success

Aficionados have developed a range of "choose your own adventure" storybooks that run on iPods, with a Web site (www.ipodsoft.com/Downloads.aspx) dedicated to the resurgence of the '80s phenomenon. Here, nestled between the explicit content stories, are a disproportionately high number of tales revolving around iPods being confiscated by teachers and their owners' valiant efforts to get them back.

If reliving your school days isn't at the top of your recreational priorities, there are other interesting downloads available. For example, the pPod project (www.nykris.com/template.php?id=64) includes reviews of 114

London public toilets to help you find the "loveliest" facility. While you're reading up on the best bags, you can listen to the accompanying soundtrack, "Music to P by", which includes Cosmic Winds and Handel's Water Music.

Both the choose your own adventure stories and pPod make use of third and fourth generation iPod's little utilised Notes facility, which can be used to transfer text from a PC or Mac to the iPod. These are simply stripped-down HTML files which include

hyperlinks to other documents and music. Obviously the possibilities don't end there, and within a few months we expect iPod users to be flush with guides to all sorts of things.

XSONIC

X-Infinity
RRP\$169

Xsonic XTablet

Imagine a computer that you can use as a note pad to draw on and carry around. Accomplish your everyday word processing requirements with writing recognition as well as taking pictures and recording major presentation at the same time.

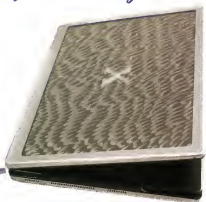

Xsonic XTablet that features a 20GB hard drive (upgradable), 2 x USB ports, an onboard network card, a 4-in-1 card reader, a digital pen and a build-in digital camera would be a simple yet economical way to organise your task on the fly

Verdict	★ ★ ★ ★ ★

Doc Ock is an overweight scientist with a lukewarm attitude and four metal tentacles sprouting out of his back. As the evil genius in the game version of *Spider-Man 2*, he has all the menace of your dad after a few too many beers on Christmas Day. Most resilient gamers can get past flaws like this if the story is up to snuff. Unfortunately, this time it's not, which goes to show that employing more French horn players in the orchestra (the credits list six) than writers for the game (four) is not a great idea.

The lack of a story is the least of this game's woes. Stop and think of *Spider-Man*'s biggest asset. It's mobility, the way he zips around with all the finesse of Rene Rivkin's legal team. But guess what? As Spidey, you can only fling out webs to a limited selection of target spots, making your progress very predictable and scripted. In a world of games emphasizing freedom and range of motion, it seems so '90s to only be able to throw out the sticky stuff at rigidly prescribed points. It's obviously not a technical problem — the far superior console versions of this game manage the feat with ease — it's just lazy.

The opening stages of the game demonstrate the developer's unwillingness to think outside the

box. You're meant to be chasing a van, but a car crash blocks a tunnel. There's ample room to jump across the bonnets of the smashed cars, or to climb up the tunnel's arch and crawl on its ceiling through the copious space above the vehicles. Try it and while Spidey goes through his movement animations, he can't move or propel himself forward. Great if you're fond of Marcel Marceau impersonations, not so great if you've been spoiled by open-plan games like *Grand Theft Auto*, or indeed any of the flood of titles designed to encourage human ingenuity.

It's a sad statement when the highlight of any game is the training mode, and that's purely because of the narrator — Bruce (*Evil Dead*) Campbell. This man could probably read the telephone directory aloud and make it sound interesting — unlike Tobey Maguire, who sounds as if he's employed the members of Cypress Hill as vocal coaches. But who wants to spend close to \$100 on a game purely for vocal entertainment?

And making a gameplay this basic while at the same time slapping enough adult content in it to justify an M rating just doesn't make sense. If *Spider-Man* had been more kiddie-oriented at least less-discerning youngsters who don't mind being bombarded with merchandising ads might have been able to play it. Our tip: develop a case of arachnophobia. Or, if you have the means, spring for the superior console versions.

Joint Operations: Typhoon Rising

One server. A handful of vehicles. 150 first person shooter players. Mayhem? Guaranteed.

Joint Operations: Typhoon Rising is undoubtedly a great programming effort. Any game that can boast 150 players on a server at the same time has to have decent network coding chops and server testing ability. Whether the upstream capacity available to Australian broadband users is up to the task of taking in what over a hundred other people are doing is not so easily discerned. If you're in the market for a 1,500/256 broadband plan — or basically anything faster than the current bog standard 128Kbit/s upstream — then

Wrang turn: the Johnsons come to regret buying budget charts for their honeymoon cruise.

you're going to find this game a lot more playable.

Joint Operations: Typhoon Rising is a multiple class, team-based first person shooter set in modern times. Mind you, you have more chance of finding weapons of mass destruction than of getting large numbers of people online to work as part of a team. The only consolation is that the opposing team faces the same handicap.

The game's graphics engine is decent, with slight concessions made to cater to large playing maps and the sheer number of people onscreen. It's a lot better than your average EverQuest-style RPG, that's for sure, even though a similar number of players is ambling about.

You get plenty of vehicles to navigate over the game's 50-plus square kilometre maps, but this is one area where shortcuts have been taken. Controlling these lumbering devices feels very artificial and doesn't have the same weighty, fine control as games like Unreal Tournament 2004 or the Battlefield series.

Taking into account Joint Operations' lack of a single play mode — except for a fair to middling tutorial — it might be wise to wait and see if the masses flock in before you do the same.

Off the island: Survivor gets nasty come voting time.

The Lowdown

▲ **Upsides:** 150 players on a server is nothing to sneeze at.
▼ **Downsides:** lack of single player mode options; poor vehicle handling.

Verdict	★★★★☆

Soldiers: Heroes of World War II

What the world needs now isn't love, it's World War III. Anything to stem the WWII game tide.

Software companies must be almost done with World War II by now — surely there's no stone left unturned throughout the Eastern Front or North Africa. To its credit, Soldiers: Heroes of World War II is a tasty little number from Codemasters that is actually worth donning your favourite *Saving Private Ryan* PJs for — no mean feat given the plethora of similar games out there.

It's portrayed in the familiar RTS style but, as in Europe, it's the little differences that you notice: a subtly impressive 3D graphics engine — both

Fixer-upper: improve property value by bombing the neighbours into oblivion.

co-op and adversarial multiplayer modes, over 100 vehicles, loads of weapons and more than 25 single player missions. And that's just the start.

The ability to control your units with a greater deal of precision than most RTSes makes this more accessible and friendly to the average fan. Subtleties, such as the need to maintain supply lines and the ability to ransack enemy resources, are well-managed and logical, rewarding forward thinkers more than furious clickers.

Some omissions that hurt the experience include the lack of warning when your units that are offscreen are under attack. A bit more notice might be handy. Instead of finding the CPU has reduced your fire team at another location to a strawberry stain. Also, pathing AI is once again a bugbear. However, Codemasters isn't alone in wrestling with this problem — most RTS games seem to be hitting trouble when it comes to giving units some autonomy.

Like *Ground Control II*, Soldiers isn't the next big pro gaming RTS platform, but it's the kind of game that all too often gets ignored in favour of that next big thing. Such a fun, polished gaming experience deserves a much better fate.

OFF THE HOOK

Transit nightmare: where the streets have no trains.

The Lowdown

▲ **Upsides:** great graphics engine; excellent single and multi-player modes.
▼ **Downsides:** lack of alerts when offscreen skirmishes take place; pathfinding.

Verdict	★★★★☆

Top 5 modern gaming icons

They may not have all been groundbreaking genre busters, but each of these titles has helped push PC gaming away from the fringe and into the spotlight.

5 COUNTER-STRIKE

Angsty fans of Sierra's Half-Life may point out that Counter-Strike was initially a freely downloadable add-on for their game. But perhaps this terrorist versus counter-terrorist mod is responsible for selling more copies of Half-Life than the game itself. Hindsight makes it easy to understand why. Prior to CS, first person shooter games were all about twitch and aim, with tactics normally taking a distant

second place. By dumbing down the gameplay, removing the emphasis on fast reflexes and rewarding methodical, cautious play, CS tapped into a vast pool of gamers previously daunted by the high-skill offerings. Like the nerdy kid at school who goes on to head a billion-dollar company, CS players have had the last laugh; the game has transformed itself into a pro platform attracting major sponsorship dollars, and is still the most popular FPS online.

4 DIABLO

Blizzard Studios is the only developer with two titles in this top five, and that's testament to the power of simplicity and focusing on gameplay above all else. Which is not to say that Diablo (and Diablo II) aren't works of art — they definitely are. While role playing purists are aghast when a game is more likely to test your mouse button than your knowledge of the Dungeons and Dragons

ruleset, there's no denying that any game that consistently has over 100,000 people playing it at any one time is doing something right. Like EverQuest, the persistent nature of the Diablo world means advanced players often auction off certain items found in-game to desperate newbies via eBay. Unlike EverQuest, Diablo and Diablo II have a set storyline and series of challenges that players take on, either in small groups or solo, and there's no subscription fee.

3 STARCRAFT

Yes, Warcraft III looks better, and the Age of Empires series has more solo appeal, but there's only one real time strategy game that has captivated gamers to such an extent it became a pro gaming platform. And that is the venerable StarCraft. It's simple enough to get into, but the number of sub-strategies and variations possible make Blizzard Studios' offering the perfect game for its time. The

North Koreans may have their eccentric "dear leader", Kim Jong-il, but South Korea can boast StarCraft as its secret weapon. South Koreans rate as the best players in the world, and top exponents there are stars in their own right, with TV shows, endorsements and book deals. And before you laugh at how desperate the Koreans are for celebrities, just remember which country took Craig McLachlan & Check 1-2 to the second-top spot on its pop charts.

2 EVERQUEST

Sony flew in the face of convention when it released this game. Hard-core gamers prophesied immediate, humiliating failure — who would actually pay full price for a game and then have to pay a monthly subscription fee to play? It doesn't even have any solo game play! EverQuest remains a true love-it-or-hate-it experience. Detractors can't understand why people are willing to endure performing repetitive, mundane

actions in order to slowly build up their online persona. Addicts will retort that the longer you play, the more you get out of the game. But the big drawcard isn't so much the barebones world that has been created, but the population — other players. As much a social exercise as a gaming one, players form alliances, enmities and their own history in-game. And the open-ended nature of play means the game is never over. That is, until the release of EverQuest II, due this year. Start saving.

1 GRAND THEFT AUTO III

Unlike every other game on this list, this title is only multiplayer if you hack up a basic multiplayer mode for it yourself. Unlike 99% of games released — again including the others on this list — GTA III has a storyline and level of characterisation that would pass muster in a decent film. And unlike any other game released to date (barring its sequel, GTA: Vice City) this game has brought about the rebirth

of computer cool, last seen taking a battering with *The Matrix* sequels. Everyone jumped on the bandwagon and it's still rolling for Rockstar Games, the now legendary makers of this third person criminal simulator. Freedom is the key. Do what you like in the big city, seamlessly blended into a natural progression of quests that actually make sense. The competition may have spent big dollars attempting to emulate the style, but our advice is this — don't bother.

PC Hardware and A+ Handbook

Details

Publisher	Microsoft Press
ISBN	0735620490
Price	\$79.95

It's not often that a book designed to prepare you for an IT certification exam can also double as a practical sourcebook. However, the *PC Hardware and A+ Handbook* delivers the rare combination of A+ examination essentials plus step by step PC troubleshooting and workshops. Heavily illustrated with photos and screenshots, little is left to the imagination.

The book starts with a bare bones history of computing and the rise of the IBM compatible, including good information on the toxicity of PC components and proper disposal and recycling procedures. This is followed by a comprehensive guide to the nuts and bolts of PC hardware — motherboards, CPUs, RAM, cases and power supplies.

Rather than taking the dry approach common to rote learning certification manuals, these sections include bonuses such as shopping tips and plain English explanations of mysteries like the workings of drivers and the elusive frontside bus. Although technology-specific hardware is addressed in the examples, the text includes

enough groundwork to prepare you for future advances in CPU types, sockets and the like.

With the essentials covered, the book moves on to explore add-on hardware, with individual sections dedicated to modems, video, audio, network cards, hard drives, removable media, monitors, printers and wireless devices. An additional chapter is dedicated to input devices such as mice, keyboards, scanners and game controllers. These are all delivered in a concise manner, with useful shopping hints and exam tips given along the way. The concluding chapters on notebooks and DIY computer building are good but hardly comprehensive. Although simplified, they nonetheless provide a basic introduction to the subject.

Overall, this title succeeds superbly as both a reference book to PC hardware as well as a study guide for the A+ exam. Because it tries to tackle so much it can lack a little detail and skim over those really hard to fix problems, but it only has to help you resolve one issue (or pass one exam) to pay for itself.

Daniel Winter

Office 2003 Timesaving Techniques for Dummies

Office 2003 Timesaving Techniques for Dummies provides... well, 72 ways to save Office users' time. These aren't simple tips such as keyboard shortcuts, they are efficient methods for carrying out real work tasks. Most of the points are also applicable to Office XP, so don't discount this book just because you haven't upgraded yet. As a bonus, experienced users of Office X and 2004 for Macintosh can easily adapt some of the techniques.

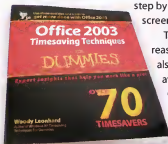

The early chapters are mainly about changing default Office settings to others that work better, and it demonstrates an easy way of transferring Office settings from one computer to another. A few of the tips delve into the use of macros, but the information is presented in a way that most Office users should be able to follow. Indeed, the entire book combines clear descriptions of scenarios,

step by step instructions and well-chosen screen grabs.

This title's primary target audience is reasonably experienced users, but it could also be useful for neophytes who want to avoid getting into inefficient habits.

Coverage of the various applications is well balanced. Those spending 90% of their Office time in a particular app, such as Excel, should look for a book specifically about that program. The rest will be happy with the variety and cross-application techniques presented here.

Best Damn Windows Server 2003 Book Period

Although this book's title is short on modesty, it tackles substantial topics including high-availability strategies, routing and remote access, troubleshooting disk and volumes, monitoring secure network activity, and the various facets of Active Directory.

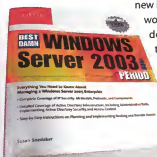

Much can be written on Windows Server 2003; indeed, Microsoft suggests that Windows Server 2003 is so feature-rich that any individual "service" in this OS has more functionality than all of Windows NT 4. In this regard, the author has done a tremendous job of producing such an accessible and concise work.

Thankfully, this book doesn't begin with trite questions like "What is Windows?" or discussions of basic subnet addressing. Instead it commences with an enthusiastic overview of what's

new in Windows Server 2003 and then works solidly through each of these developments. Every necessary topic to set up and run an efficient and secure server is covered.

Not that it's perfect. There's nothing on BAT files, scripting or replicating Active Directory across a firewall. That said, resources on command files are plentiful and such advanced topics are relevant only to a few. This book is recommended to all Windows Server 2003 administrators.

How to Do Everything with Photoshop CS

How to Do Everything with Photoshop CS is aimed at amateur photographers who want to significantly improve original images with their PCs, and it provides a useful introduction to Photoshop's basic capabilities.

Opening with the standard chapters on the Photoshop interface and toolbars, the book then moves onto working with layers and manipulating text. Each concept or procedure is clearly explained and accompanied by sample photographs and screenshots.

Though the range of material covered is sufficient for most, there is one unfortunate omission. The RAW format is commonly utilised to download photographs from a digital camera, but this guide neglects to explain how such images can be imported and manipulated in Photoshop.

Despite that oversight, this book provides a comprehensive introduction to the Photoshop environment.

Alan Crawford

Foundations of Algorithms

Using Java Pseudocode

Algorithms are the foundation of computer science and are important for any programmer who wants to produce efficient and reliable code. By evil necessity, any discussion of algorithms must include a lot of mathematics. Happily, this title excels because the maths is greatly simplified and the authors use clear English and simple notation.

As the title suggests, the algorithms developed throughout the text are presented in a Java-like language that focuses on the mechanics of the algorithm and excludes all the necessary Java housekeeping. But it's close enough for any competent Java programmer to transform an algorithm into working code, even if they don't work through all the maths.

The book covers a broad range of algorithms, grouped according to function, including Huffman coding.

David Williams

Keep Your Kids Safe on the Internet

Promising to help the parents of young children safeguard against "paedophiles, cyber-stalkers, viruses, hackers and spyware", this book delves straight into the most serious of subjects, such as "Paedophiles are Using the Internet to Look for Kids". Though it appears sensationalist, the author supports his assertion with a number of statistics designed to impress upon parents the importance of this issue.

The remainder of the text is then dedicated to reviewing and testing the various software packages available to improve Internet safety. Filtering software presents the most obvious and practical choice, with several options examined in detail. Alternative means of enhancing security are also tested and discussed, including firewalls, antivirus apps and malicious software detectors.

Keep Your Kids Safe on the Internet presents a useful overview of the options available for improving the online safety of children.

Alan Crawford

Programming and Problem Solving with C++, 4th edition

Essentially an undergraduate textbook for university computer science courses, this title provides a clear introduction to C++, object-oriented programming and software development.

A large section of the book is devoted to the basic premises of programming in general. It then progresses onto C++, moving from the fundamentals onto abstract data types, templates, inheritance, encapsulation and object-oriented design.

ISO/ANSI standard C++ is used throughout the book, making it current and precise but also version-neutral, with no reference to the use or idiosyncracies of any specific implementation. A possible weakness however, is that the book offers no coverage of GUI programming and all input/output is via the console.

That aside, the authors meticulously detail the way the C++ standard has evolved and provide an appendix to help migrate nagging code problems from one standard to another.

mmm,
DATA

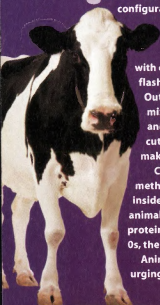

BOVINE STORAGE

Cows are known for their freaky four stomach configuration to store and process digested food. So maybe it's not too ridiculous to think that cows = storage.

Startup companies are now playing with cow guts to make replacement hard drives, flash memory and other storage devices. Outfits such as UK-based NanoMagnetics are mixing molten silicon, synthetic molecules and cow protein globules in the hope of cutting manufacturing costs for storage makers.

CNET reports that the firm has "developed methods for inserting a magnetised particle inside a sphere of ferritin, a protein produced by animals. Assembled in arrays, the magnetised protein globs can be flipped to represent 1s and 0s, the basic units of digital information."

Animal rights activists are expected to start urging people to "please think of the cows".

ERMmmmm...

European tech magazines do things differently. First there are the attractive women on the covers. The thinking from publishing executives goes like this: "Hey, it's mostly blokes who buy tech mags, and, like, most blokes dig chicks, right, and sex sells, right, so why not put babes on the cover? 'Cause that'll make people buy the mag, right? Technology is hot, hot women. Geddit?"

Until now, though, the women have mostly been standing there looking vaguely uncomfortable. Not any more. This cover suggests things have taken a turn for the slightly surreal. Yes, this woman is licking a graphics card. Not even Nostradamus saw that coming.

This mag has a name, but really it needs a new one. Send your suggestions to chipchat@apcmag.com.

PITY THE FOOL

After a long day of Danish tarts, scones, and a parade of Ivory tower thinkers at a recent International Telecommunications Union (ITU) meeting, Dr Robert Horton found himself rubber stamping an ambitious plan. Gripped by hyperbole and the warrior vernacular of our time, he got so revved up that he ripped with: "I am convinced that we can curb spam within the next two years if we act on a number of fronts simultaneously..."

Two years eh, Bob? Mind you, he's in a top position to make things happen. Besides being chairman of the ITU committee on countering spam, Bob's day job is deputy chair of the Australian Communications Authority. We eagerly await ACA action meeting its rhetoric.

SPAM IS
BAD, MINKAY

BLOCKBUSTER conferences

Okay, some conferences are best described as only for the truly dedicated — Storage World being a case in point.

But we've recently noticed a new trend in marketing tech conferences. Borrowing from '50s B-grade cinema, Email Management World (no lie!) depicts a man being crushed by a giant @ symbol that clearly threatens to oppress humankind. Even his purple suit is no protection against this menace.

Send us the top 10 blockbuster conferences coming soon to a hall near you. chipchat@apcmag.com.
